WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Santiago

* Fogo

* Brava

A Tropical Storm Warning means that tropical storm conditions are
expected somewhere within the warning area within 36 hours.

For storm information specific to your area, please monitor products
issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 200 PM AST (1800 UTC), the disturbance was centered near latitude
12.9 North, longitude 19.0 West. The system is moving toward the
west near 12 mph (19 km/h), and this general motion with a gradual

turn toward the west-northwest is expected to continue during the next few days. On the forecast track, the disturbance is expected to move near or over the southern Cabo Verde Islands on Friday. Maximum sustained winds are near 30 mph (45 km/h) with higher gusts. Some strengthening is forecast during the next 48 hours, the disturbance is expected to become a tropical storm during the next day or so.

and

Environmental conditions are favorable for the system to become a tropical cyclone tonight or Friday.

* Formation chance through 48 hours...high...80 percent

* Formation chance through 5 days...high...90 percent

The estimated minimum central pressure is 1007 mb (29.74 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce total rain accumulations of 8 inches across the southern Cabo Verde Islands. These rains could produce life-threatening flash floods.

4 to

WINDS: Tropical storm conditions are expected in the southern Cabo Verde Islands on Friday.

TTAA00 KNHC DDHHMM

Potential Tropical Cyclone Six Discussion Number 3

NWS National Hurricane Center Miami FL AL062018

1100 PM AST Thu Aug 30 2018

Satellite imagery indicates that the disturbance is gradually becoming better organized. However, the convection is not yet well enough organized to call the system a tropical cyclone, and recent scatterometer data show that the system still lacks a well-defined center of circulation. The scatterometer did indicate winds of 25-30 kt, so the initial intensity is nudged upward to 30 kt. The system should be in an environment of light to moderate easterly vertical shear for the next three to four days. Sea surface temperatures decrease along the forecast track during this time, though, reaching 26C by 72-96 h. The intensity guidance suggests that the system should at least slowly develop despite the falling SSTs, and based on this the new intensity forecast calls for

it to become a tropical depression in about 12 h, a tropical storm in 12-24 h, and a hurricane near the 96-h point. While the system is expected to reach warmer SSTs near the end of the forecast period, it is also expected to encounter westerly shear at that time, which should limit additional intensification.

The initial motion is a somewhat uncertain 280/11. The trade winds on the south side of the subtropical ridge should steer the system west-northwestward with an increase in forward speed during the next 3-4 days, passing near or over the southern Cabo Verde Islands Friday or Friday night. Near the end of the forecast period, a turn toward the northwest is forecast as the system approaches a weakness in the ridge. The new track forecast is again little changed from the previous forecast and lies near the various consensus models. It should be noted that some adjustments to the early parts of the forecast track may occur until the center becomes better defined.

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

The government of the Cabo Verde Islands has issued a Tropical Storm Warning for the southern islands of Santiago, Fogo and Brava.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Santiago

* Fogo

* Brava

A Tropical Storm Warning means that tropical storm conditions are expected somewhere within the warning area within 36 hours.

For storm information specific to your area, please monitor products issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the disturbance was centered near latitude 12.9 North, longitude 18.4 West. The system is moving toward the west near 12 mph (19 km/h), and this general motion with a gradual turn toward the west-northwest is expected to continue during the next few days. On the forecast track, the disturbance is expected to move near or over the southern Cabo Verde Islands on Friday.

Maximum sustained winds are near 30 mph (45 km/h) with higher gusts. Some strengthening is forecast during the next 48 hours, and the disturbance is expected to become a tropical storm during the next day or so.

Environmental conditions are favorable for the system to become a tropical cyclone tonight or Friday.

* Formation chance through 48 hours...high...80 percent

* Formation chance through 5 days...high...90 percent

The estimated minimum central pressure is 1007 mb (29.74 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce total rain accumulations of 4 to 8 inches across the southern Cabo Verde Islands. These rains could produce life-threatening flash floods.

WINDS: Tropical storm conditions are expected in the southern Cabo Verde Islands on Friday.

NEXT ADVISORY

Next intermediate advisory at 200 PM AST.

Next complete advisory at 500 PM AST.

Potential Tropical Cyclone SIX

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Potential Tropical Cyclone Six Discussion Number 2

NWS National Hurricane Center Miami FL AL062018

500 PM AST Thu Aug 30 2018

The area of low pressure has continued to become better defined, and is still accompanied by a large area of disturbed weather with gusty winds. However, the system lacks a well-defined center, and Dvorak classifications do not support to classify the disturbance as a tropical depression at this time. An environment of high moisture and low shear favors genesis, and the disturbance is expected to become a tropical cyclone within the next 12 to 24 hours. These favorable conditions are expected to prevail, so the NHC forecast gradually brings the winds up at a similar rate as the intensity consensus.

Since the system lacks a well defined center, the initial motion is uncertain. The best estimate is toward the west or 280 degrees at 8 kt. The disturbance is moving rather slow because it is still embedded within the strong southwesterly monsoonal flow. Once it moves away from that region near Africa, it will be steered by the trade winds around the subtropical ridge, and the system will increase its westward or west-northwestward forward speed. By the end of the forecast period, a turn toward the northwest should begin as the cyclone reaches a weakness in the subtropical high. The NHC forecast is similar to the earlier one, and is in between the corrected consensus HCCA and the multi-model aids.

Potential Tropical Cyclone SIX

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Potential Tropical Cyclone Six Discussion Number 1

NWS National Hurricane Center Miami FL AL062018

1100 AM AST Thu Aug 30 2018

The area of low pressure that moved off the coast of Africa has continued to become better organized, and is producing a large area of disturbed weather with gusty winds, but currently lacks a well-defined center. Environmental conditions are favorable for additional development, and a tropical depression or a tropical storm could form at any time today or Friday. Given the high chances that this system could bring tropical storm conditions to a portion of the southern Cabo Verde Islands, advisories have been initiated on Potential Tropical Cyclone Six. Most of the intensity guidance calls for strengthening and so does the NHC forecast. The system is embedded within the easterly trades and this flow pattern will steer the disturbance toward the west or west-northwest during the next few days. By the end of the forecast period, a turn toward the northwest should begin as the system reaches a weakness in the subtropical high. This is consistent with the output of the global models.

TTAA00 KNHC DDHHMM

Potential Tropical Cyclone Six Discussion Number 2

NWS National Hurricane Center Miami FL AL062018

500 PM AST Thu Aug 30 2018

The area of low pressure has continued to become better defined, and is still accompanied by a large area of disturbed weather with gusty winds. However, the system lacks a well-defined center, and Dvorak classifications do not support to classify the disturbance as a tropical depression at this time. An environment of high moisture and low shear favors genesis, and the disturbance is expected to become a tropical cyclone within the next 12 to 24 hours. These favorable conditions are expected to prevail, so the NHC forecast gradually brings the winds up at a similar rate as the intensity consensus.

Since the system lacks a well defined center, the initial motion is uncertain. The best estimate is toward the west or 280 degrees at 8 kt. The disturbance is moving rather slow because it is still embedded within the strong southwesterly monsoonal flow. Once it moves away from that region near Africa, it will be steered by the trade winds around the subtropical ridge, and the system will increase its westward or west-northwestward forward speed. By the end of the forecast period, a turn toward the northwest should begin as the cyclone reaches a weakness in the subtropical high. The NHC forecast is similar to the earlier one, and is in between the corrected consensus HCCA and the multi-model aids.

Potential Tropical Cyclone Six Advisory Number 3

NWS National Hurricane Center Miami FL AL062018

1100 PM AST Thu Aug 30 2018

...DISTURBANCE GRADUALLY BECOMING BETTER ORGANIZED...

...HEAVY RAINS AND GUSTY WINDS EXPECTED IN THE SOUTHERN CABO VERDE ISLANDS ON FRIDAY...

SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...13.2N 20.9W

ABOUT 260 MI...415 KM ESE OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...35 MPH...55 KM/H

PRESENT MOVEMENT...W OR 280 DEGREES AT 13 MPH...20 KM/H

MINIMUM CENTRAL PRESSURE...1007 MB...29.74 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Santiago

* Fogo

* Brava

A Tropical Storm Warning means that tropical storm conditions are expected somewhere within the warning area, in this case, within the next 24 to 36 hours.

For storm information specific to your area, please monitor products issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the disturbance was centered near latitude 13.2 North, longitude 20.9 West. The system is moving toward the west near 13 mph (20 km/h), and a general motion toward the west-northwest with an increase in forward speed is expected during the next 2 to 3 days. On the forecast track, the disturbance or the tropical cyclone is expected to move near or over the southern Cabo Verde Islands on Friday and Friday night. Maximum sustained winds are near 35 mph (55 km/h) with higher gusts. Strengthening is forecast, and the disturbance is expected to become a tropical storm Friday or Friday night.

Environmental conditions are favorable for the system to become a tropical cyclone on Friday.

* Formation chance through 48 hours...high...90 percent

* Formation chance through 5 days...high...90 percent

The estimated minimum central pressure is 1007 mb (29.74 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce total rain accumulations of 8 inches across the southern Cabo Verde Islands. These rains could produce life-threatening flash floods.

4 to

WINDS: Tropical storm conditions are expected in the southern Cabo Verde Islands on Friday.

NEXT ADVISORY

Next intermediate advisory at 200 AM AST.

Next complete advisory at 500 AM AST.

BULLETIN

Potential Tropical Cyclone Six Advisory Number 2

NWS National Hurricane Center Miami FL AL062018

500 PM AST Thu Aug 30 2018

...HEAVY RAINS AND GUSTY WINDS EXPECTED IN THE SOUTHERN CABO VERDE
ISLANDS ON FRIDAY...

SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...12.9N 19.4W

ABOUT 360 MI...580 KM ESE OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...30 MPH...45 KM/H

PRESENT MOVEMENT...W OR 280 DEGREES AT 9 MPH...15 KM/H

MINIMUM CENTRAL PRESSURE...1007 MB...29.74 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Santiago

* Fogo

* Brava

A Tropical Storm Warning means that tropical storm conditions are expected somewhere within the warning area, in this case, within the next 24 to 36 hours.

For storm information specific to your area, please monitor products issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the disturbance was centered near latitude 12.9 North, longitude 19.4 West. The system is moving toward the west near 9 mph (15 km/h), and a general west to west-northwest track with an increase in forward speed is expected during the next 2 to 3 days. On the forecast track, the disturbance or the tropical cyclone is expected to move near or over the southern Cabo Verde Islands on Friday.

Maximum sustained winds remain near 30 mph (45 km/h) with higher gusts. Some strengthening is forecast, and the disturbance is expected to become a tropical storm during the next day or so. Environmental conditions are favorable for the system to become a tropical cyclone tonight or Friday.

* Formation chance through 48 hours...high...80 percent

* Formation chance through 5 days...high...90 percent

The estimated minimum central pressure is 1007 mb (29.74 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce total rain accumulations of 8 inches across the southern Cabo Verde Islands. These rains could produce life-threatening flash floods.

4 to

WINDS: Tropical storm conditions are expected in the southern Cabo Verde Islands on Friday.

NEXT ADVISORY

Next intermediate advisory at 800 PM AST.

Next complete advisory at 1100 PM AST.

Tropical Storm Florence Advisory Number 17

NWS National Hurricane Center Miami FL 1100 AM AST Mon Sep 03 2018
AL062018

...FLORENCE A LITTLE STRONGER AS IT CONTINUES MOVING ACROSS THE
CENTRAL TROPICAL ATLANTIC...

SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...18.3N 38.7W

ABOUT 980 MI...1580 KM W OF THE CABO VERDE ISLANDS

ABOUT 1505 MI...2425 KM E OF THE LESSER ANTILLES

MAXIMUM SUSTAINED WINDS...65 MPH...100 KM/H

PRESENT MOVEMENT...WNW OR 285 DEGREES AT 16 MPH...26 KM/H

MINIMUM CENTRAL PRESSURE...997 MB...29.44 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the center of Tropical Storm Florence was located near latitude 18.3 North, longitude 38.7 West. Florence is moving toward the west-northwest near 16 mph (26 km/h), and a westward to west-northwestward motion is expected to continue through Thursday morning.

Maximum sustained winds have increased to near 65 mph (100 km/h) with higher gusts. Some additional strengthening is expected later today, followed by a slow weakening trend starting on Tuesday. Tropical-storm-force winds extend outward up to 60 miles (95 km) from the center.

The estimated minimum central pressure is 997 mb (29.44 inches).

HAZARDS AFFECTING LAND

None.

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Tropical Storm Florence was located near latitude 18.9 North, longitude 41.0 West. Florence is moving toward the west-northwest near 14 mph (22 km/h). A slightly slower west-northwestward to northwestward motion is expected during the next few days.

Maximum sustained winds remain near 70 mph (110 km/h) with higher gusts. Little change in strength is expected through tonight, but some weakening is forecast on Tuesday and Wednesday.

Tropical-storm-force winds extend outward up to 80 miles (130 km) from the center.

The estimated minimum central pressure is 995 mb (29.39 inches).

HAZARDS AFFECTING LAND

None.

NEXT ADVISORY

Next complete advisory at 500 AM AST.

Tropical Storm Florence Discussion Number 16

NWS National Hurricane Center Miami FL 500 AM AST Mon Sep 03 2018

AL062018

The structure of Florence has recovered overnight. Several recent microwave images indicate that the tropical storm's center is still dislocated to the south of most of the associated convection, but convective banding has increased. There is also evidence that Florence has developed better defined low-level inner-core.

Satellite intensity estimates have increased and now range from 45 to 60 kt. As a compromise of the various estimates, the initial intensity has been raised slightly to 50 kt, but its worth noting that this increase is within the noise level of our ability to observe the intensity of tropical storms over the open ocean.

Based on SHIPS diagnostics, the southwesterly shear affecting Florence could remain moderate for the next 12 h, and some slight intensification is possible. However, by 24 h, an increase in the shear should kick off a gradual weakening trend. By the end of the forecast period, the tropical storm is forecast to re-intensify

while it moves over warmer SSTs and the environmental shear decreases. Given the improved current structure of Florence, the new official intensity forecast shows slight intensification for the first 12 h. Beyond that time, the models are in good agreement and the NHC forecast is near the middle of the relatively tight intensity guidance envelope.

The tropical storm is still moving west-northwestward, at an estimated 14 kt. A continued west to west-northwest motion is forecast by all the global models for the next couple of days. By the end of the forecast period, nearly all of the guidance shows a turn toward the northwest, and the main source of uncertainty in the track forecast continues to be exactly when and to what extent Florence will make this turn. At this point I have no reason to depart from the various consensus models, and the track forecast is very close to the previous advisory.

FORECAST POSITIONS AND MAX WINDS

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 17

NWS National Hurricane Center Miami FL 1100 AM AST Mon Sep 03 2018
AL062018

While Florence's structure improved overnight, the cloud tops have warmed and the deep convection has thinned during the past several hours. The 12Z satellite intensity estimates range from 55 to 65 kt, but given recent trends the initial intensity is set at the low end of that range at 55 kt, although this is quite uncertain given the recent fluctuations in the cloud pattern.

UW-CIMSS satellite diagnostics indicate that around 20 kt of southwesterly shear is affecting Florence, while the SHIPS analysis based on the GFS fields shows only about 10 kt. SSTs warm from this point forward along the forecast track, but shear is expected to be steady or strengthen, and the mid-level relative humidity values decrease to around 50 percent during the next 48 to 72 hours. Given these mixed factors, the NHC intensity forecast shows some possibility for strengthening in the next 12 hours, followed by a slow decay through 72 hours. Some restrengthening is forecast late

in the period as SSTs warm above 28C and the atmospheric moisture increases. The NHC forecast is close to or a bit above the latest IVCN consensus aid and about 5 kt above the previous NHC forecast through 96 hours.

The initial motion estimate is 285/14. Florence will be steered generally west-northwestward for the next 72 hours by the Atlantic subtropical ridge, followed by a northwestward turn at days 4 and 5. While there is large spread in the guidance between the HWRF on the right and the UKMET on the left, the GFS, ECMWF, and their ensemble means are more tightly clustered near the middle of the guidance envelope. Since the overall track forecast reasoning has not changed, the new NHC forecast remains near the middle of the guidance. This forecast is a bit north of the previous NHC track given the initial position and lies a little south of the consensus aids to reflect less influence of the outlier HWRF model to the north.

FORECAST POSITIONS AND MAX WINDS

Tropical Storm FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 18

NWS National Hurricane Center Miami FL 500 PM AST Mon Sep 03 2018

AL062018

Florence appears a little better organized than earlier today. Deep convection is slightly stronger near and to the north of the center, and the cloud pattern still resembles a central dense overcast. A blend of the latest Dvorak classifications suggests a slightly higher wind speed, and accordingly, the initial intensity is nudged upward to 60 kt.

The strong tropical storm is moving westward, or 280 degrees, at 13 kt steered by a subtropical ridge to its north. The global models all show a persistent weakness in the subtropical ridge during the next several days due to a series of troughs moving across the Atlantic. In response, Florence is expected to gradually turn

northwestward with a slight reduction in forward speed during the next several days. While there remains a fair amount of spread in the models from 72 to 120 h, there has been a notable trend to the right, or north, during the past few model cycles. The official track forecast is adjusted slightly to the right as well, trending toward the latest consensus aids.

Little change in strength is expected through tonight as Florence remains over marginally warm waters and in moderate wind shear conditions. However, nearly all of the intensity models show a slow weakening trend during the next few days. This weakening is in response to a gradual increase in southwesterly or westerly shear. Beyond a few days, however, the shear is expected to decrease and Florence will be over much warmer waters. Therefore, slow strengthening is shown in the 3 to 5 day period. This forecast is slightly higher than the previous one at the longer range, but is otherwise unchanged.

FORECAST POSITIONS AND MAX WINDS

INIT 03/2100Z 18.6N 39.8W 60 KT 70 MPH

BULLETIN

Tropical Storm Florence Advisory Number 16

NWS National Hurricane Center Miami FL 500 AM AST Mon Sep 03 2018

...FLORENCE CONTINUES WEST-NORTHWESTWARD...

AL062018

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...18.0N 37.5W

ABOUT 895 MI...1440 KM WNW OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...60 MPH...95 KM/H

PRESENT MOVEMENT...WNW OR 285 DEGREES AT 16 MPH...26 KM/H

MINIMUM CENTRAL PRESSURE...999 MB...29.50 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Tropical Storm Florence was located near latitude 18.0 North, longitude 37.5 West. Florence is moving toward the west-northwest near 16 mph (26 km/h). The tropical storm is expected to move generally westward to west-northwestward at a slightly slower forward speed for the next several days.

Maximum sustained winds are near 60 mph (95 km/h) with higher gusts. Little change in intensity is expected over the next several days. Tropical-storm-force winds extend outward up to 60 miles (95 km) from the center.

The estimated minimum central pressure is 999 mb (29.50 inches).

HAZARDS AFFECTING LAND

None.

NEXT ADVISORY

Next complete advisory at 1100 AM AST.

Tropical Storm Florence Discussion Number 19

NWS National Hurricane Center Miami FL 1100 PM AST Mon Sep 03 2018

AL062018

Although Florence continues to produce a fairly circular area of deep convection, microwave images have revealed that there is a significant southwest-to-northeast vertical tilt of the circulation due to southwesterly shear. The initial intensity is held at 60 kt, using a blend of the Dvorak CI-numbers from TAFB and SAB. This estimate is a little below the latest automated Dvorak values from CIMSS at the University of Wisconsin.

The strong tropical storm is moving west-northwestward, or 285 degrees, at 12 kt steered by a subtropical ridge to its north. The storm is expected to gradually turn northwestward with a decrease in forward speed during the next several days as it moves toward a persistent weakness in the subtropical ridge. There remains a fair amount of spread in the guidance, especially in the 3- to 5-day time period, but the consensus aids have changed little this cycle. Therefore, no significant changes were made to the previous forecast, and this one lies near the middle of the guidance envelope.

Little change in strength is expected through early Tuesday as Florence remains over marginally warm waters and in moderate wind shear conditions. Slight weakening is expected during the middle part of the week due to a gradual increase in southwesterly or westerly shear. Beyond that time, however, the shear is expected to decrease and Florence will be over much warmer waters. Therefore, slow strengthening is shown at the end of the forecast period. This forecast is unchanged from the previous one, and is in good agreement with the HCCA guidance.

The 34- and 50-kt initial wind radii have been expanded outward based on recent ASCAT passes.

Tropical Storm Florence Advisory Number 20

NWS National Hurricane Center Miami FL 500 AM AST Tue Sep 04 2018
AL062018

...FLORENCE STILL JUST BELOW HURRICANE STRENGTH...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...19.3N 42.0W
ABOUT 1205 MI...1940 KM WNW OF THE CABO VERDE ISLANDS
ABOUT 1300 MI...2090 KM ENE OF THE LESSER ANTILLES
MAXIMUM SUSTAINED WINDS...70 MPH...110 KM/H
PRESENT MOVEMENT...WNW OR 290 DEGREES AT 13 MPH...20 KM/H
MINIMUM CENTRAL PRESSURE...995 MB...29.39 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Tropical Storm Florence was located near latitude 19.3 North, longitude 42.0 West. Florence is moving toward the west-northwest near 13 mph (20 km/h), and this general motion is expected to continue for the next couple of days followed by a turn toward the northwest around Friday.

Maximum sustained winds are near 70 mph (110 km/h) with higher gusts. Little change in strength is expected through tonight, but some weakening is forecast on Wednesday. Afterward, gradual strengthening is forecast through the weekend.

Tropical-storm-force winds extend outward up to 80 miles (130 km) from the center.

The estimated minimum central pressure is 995 mb (29.39 inches).

HAZARDS AFFECTING LAND

None.

TTAA00 KNHC DDHHMM

Hurricane Florence Discussion Number 22

NWS National Hurricane Center Miami FL 500 PM AST Tue Sep 04 2018

AL062018

Despite being over marginally warm water and in an environment of moderate west-southwesterly shear, Florence's intensity has increased during the day. The hurricane has a cloud-filled eye in visible imagery, and the central dense overcast is becoming more symmetric. Based on Dvorak estimates of T4.5 from TAFB and SAB, and a SATCON estimate of 77 kt, the initial intensity is now, somewhat surprisingly, 75 kt. Since the current intensification

trend may not be over, the official forecast calls for Florence to strengthen just a little more during the next 6-12 hours. Even though the hurricane will be moving over progressively warmer waters, increasing vertical shear and dry air in the middle levels of the atmosphere should induce some weakening in the 24-72 hour time frame. Lower shear after 72 hours will likely allow Florence to regain hurricane strength by the end of the forecast period. The NHC intensity forecast is primarily adjusted to account for the recent strengthening trend, and is closest to the Florida State Superensemble and HCCA guidance.

Florence remains on a west-northwestward course at 300/10 kt. This trajectory is expected to continue through 36 hours while the hurricane remains near the southwestern edge of the subtropical ridge. After 36 hours, Florence is expected to turn northwestward and slow down as it enters a break in the ridge. The track models are in good agreement and show little spread through 48 hours. On days 3-5, the biggest outlier is the UKMET, which lies to the south of the guidance suite. In fact, the bulk of the models, including the deterministic GFS and ECMWF, are all now showing a more definitive poleward motion by day 5. While the official NHC track forecast reflects this thinking, there is still considerable spread among the associated global model ensembles, and the longer-term forecast should be considered low confidence.

FORECAST POSITIONS AND MAX WINDS

Hurricane Florence Discussion Number 21

NWS National Hurricane Center Miami FL 1100 AM AST Tue Sep 04 2018
AL062018

Florence's structure has gradually increased in organization, with SSMIS passes from a few hours ago revealing the development of a mid-level microwave eye. Dvorak estimates have responded in kind--TAFB is up to T4.0, SAB is at T4.5, and the objective ADT is in between at T4.4. Since there still appears to be moderate southwesterly shear inducing some tilt to the cyclone and disrupting the infrared satellite pattern, the initial intensity is raised conservatively to 65 kt, making Florence a hurricane. The current motion remains west-northwestward, or 295/10 kt, with Florence positioned near the southwestern edge of the subtropical ridge. The steering pattern ahead of Florence is rather complicated and will be evolving over the next few days. A large and complex mid-/upper-level trough located northeast of the Leeward Islands is expected to give way to the development of two upper-level highs centered near the Greater Antilles and southwest of the Azores, with Florence slowing down and turning northwestward between these new features. Despite this complex pattern, the spread in the track models is less than normal, which increases the confidence in the NHC track forecast for the next 5 days. There is some spread which begins to develop around day 5, with the ECMWF model moving Florence a little faster toward the north while the GFS maintains a slower speed and keeps the system to the south. The updated NHC track forecast has been nudged slightly to the east of the previous forecast on days 4 and 5, close to the TVCX consensus but not as far as the HCCA and ECMWF models. There is still too much model spread after day 5 to speculate what Florence might do beyond the official forecast period.

Despite Florence becoming a hurricane, the southwesterly shear affecting the cyclone is expected to increase over the next day or two, which should prevent further intensification. In fact, the increasing shear, as well as mid-level relative humidities below 50 percent, should cause weakening between 24 and 72 hours. After 72 hours, decreasing shear and warmer sea surface temperatures should foster some re-intensification, with Florence expected to reattain hurricane intensity by day 5. The intensity guidance is in good agreement, and the NHC forecast is very close to a blend of HCCA, the Florida State Superensemble, and the ICON consensus.

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 20

NWS National Hurricane Center Miami FL 500 AM AST Tue Sep 04 2018

AL062018

Florence's cloud pattern has changed very little during the past several hours, with the exception of a possible small Central Dense Overcast developing just to the east of the center. An earlier AMSR2 overpass revealed a rather obvious tilt toward the east-northeast, indicative of the moderate southwesterly shear. The initial intensity is held a 60 kt, and is supported by the Dvorak subjective and objective T-numbers.

Florence should exhibit little change in strength during the next 24 hours or so, as the cyclone traverses marginally warm sea surface temperatures and is influenced by modest west-southwesterly shear. Slight weakening is expected during the mid- forecast period as the shear gradually increases with time. Afterward, the upper-level wind environment should become a little more favorable and, at the same time, Florence will be moving back over warmer SSTs.

Consequently, the cyclone should gradually strengthen through day 5. This forecast is unchanged from the previous one, and is in good agreement with the NOAA-HCCA guidance.

The initial motion estimate is west-northwestward, or 290/11 kt. The cyclone is expected to be steered west-northwestward for the next 48 hours by a mid- to upper tropospheric ridge anchored to the north, followed by a northwestward turn around the 72 hr period as it enters a growing weakness in the aforementioned ridge. A rather large spread in the global and hurricane models remains particularly beyond day 4, however, the consensus models and the global ensemble means have been fairly consistent from run to run. This forecast is just a bit to the north of the previous advisory and just south of the consensus models.

BULLETIN

Hurricane Florence Advisory Number 23
NWS National Hurricane Center Miami FL 1100 PM AST Tue Sep 04 2018
AL062018

...FLORENCE NOW A CATEGORY 2 HURRICANE OVER THE OPEN ATLANTIC...
SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...20.7N 43.9W
ABOUT 1260 MI...2030 KM E OF THE NORTHERN LEEWARD ISLANDS
ABOUT 1515 MI...2440 KM ESE OF BERMUDA
MAXIMUM SUSTAINED WINDS...100 MPH...155 KM/H
PRESENT MOVEMENT...WNW OR 300 DEGREES AT 12 MPH...19 KM/H
MINIMUM CENTRAL PRESSURE...976 MB...28.82 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.
DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Hurricane Florence was located near latitude 20.7 North, longitude 43.9 West. Florence is moving toward the west-northwest near 12 mph (19 km/h), and this general motion is expected to continue through Wednesday night. A northwestward motion is expected to begin by Thursday with Florence's forward speed decreasing by the weekend. Maximum sustained winds have increased to near 100 mph (155 km/h) with higher gusts. Some additional strengthening could occur overnight, but a slow weakening trend is forecast to begin on Wednesday and continue through Friday. Hurricane-force winds extend outward up to 15 miles (30 km) from the center and tropical-storm-force winds extend outward up to 105 miles (165 km). The estimated minimum central pressure is 976 mb (28.82 inches).

HAZARDS AFFECTING LAND

None.

BULLETIN

Hurricane Florence Advisory Number 22

NWS National Hurricane Center Miami FL 500 PM AST Tue Sep 04 2018

...FLORENCE STRONGER THAN ANTICIPATED...

...STILL NO THREAT TO LAND THROUGH THE WEEKEND...

AL062018

SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...20.3N 43.2W

ABOUT 1305 MI...2100 KM E OF THE NORTHERN LEEWARD ISLANDS

MAXIMUM SUSTAINED WINDS...85 MPH...140 KM/H

PRESENT MOVEMENT...WNW OR 300 DEGREES AT 12 MPH...19 KM/H

MINIMUM CENTRAL PRESSURE...984 MB...29.06 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the center of Hurricane Florence was located near latitude 20.3 North, longitude 43.2 West. Florence is moving toward the west-northwest near 12 mph (19 km/h), and this general motion is expected to continue through Wednesday night. A northwestward motion is expected to begin by Thursday with Florence's forward speed decreasing by the weekend.

Maximum sustained winds have increased to near 85 mph (140 km/h) with higher gusts. Some additional strengthening is possible through tonight, but Florence is expected to weaken beginning on

Wednesday and continuing through Friday.
Hurricane-force winds extend outward up to 15 miles (30 km) from the center, and tropical-storm-force winds extend outward up to 105 miles (165 km).

The estimated minimum central pressure is 984 mb (29.06 inches).

HAZARDS AFFECTING LAND

None.

Hurricane Florence Advisory Number 21

NWS National Hurricane Center Miami FL 1100 AM AST Tue Sep 04 2018
AL062018

...FLORENCE BECOMES THE THIRD HURRICANE OF THE ATLANTIC SEASON...

...NO THREAT TO LAND THROUGH THE WEEKEND...

SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...19.7N 42.5W

ABOUT 1240 MI...2000 KM WNW OF THE CABO VERDE ISLANDS

ABOUT 1270 MI...2045 KM ENE OF THE LESSER ANTILLES

MAXIMUM SUSTAINED WINDS...75 MPH...120 KM/H

PRESENT MOVEMENT...WNW OR 295 DEGREES AT 12 MPH...19 KM/H

MINIMUM CENTRAL PRESSURE...990 MB...29.24 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the center of Hurricane Florence was located near latitude 19.7 North, longitude 42.5 West. Florence is moving toward the west-northwest near 12 mph (19 km/h), and this motion is expected to continue through Wednesday. A slower northwestward motion is forecast to begin Thursday and continue through the weekend.

Maximum sustained winds have increased to near 75 mph (120 km/h) with higher gusts. Little change in strength is expected through tonight, but weakening is forecast to begin on Wednesday and continue through Friday.

Hurricane-force winds extend outward up to 15 miles (30 km) from the center, and tropical-storm-force winds extend outward up to 105 miles (165 km).

The estimated minimum central pressure is 990 mb (29.24 inches).

HAZARDS AFFECTING LAND

None.

NEXT ADVISORY

Next complete advisory at 500 PM AST.

Hurricane Florence Discussion Number 23

NWS National Hurricane Center Miami FL 1100 PM AST Tue Sep 04 2018

AL062018

GOES-16 imagery shows that the eye of Florence has become better defined during the last several hours, with even some mesovortices in the eye present on the shortwave infrared channel. Satellite intensity estimates continue to rise, and the initial wind speed is set to 85 kt, just below the latest TAFB estimate of 90 kt.

Florence remains on a west-northwestward course at 300/10 kt. This general course is expected to continue through 36 or 48 hours while the hurricane remains near the southwestern edge of the subtropical ridge. After that time, the forecast becomes more uncertain, depending on the presence of a narrow mid-level ridge over the north-central Atlantic Ocean. A look at the ensemble guidance shows a bifurcation developing by day 5, with the ECMWF favoring a more northward turn, and the UKMET ensembles showing a stronger ridge and a continuation of a west-northwest track. The new NHC forecast is adjusted westward at long range, in line with the corrected-consensus aids, but don't be surprised if this forecast undergoes some large changes in the next few cycles, given the split in the guidance.

This intensity forecast is also difficult. Florence certainly has exceeded expectations during the last day or so, with the hurricane on the verge of rapidly intensifying during the last 24 hours despite a marginal environment. Some more strengthening is called for in the short term to reflect the current trend. However, the global models continue to insist that southwesterly shear will increase over the next couple of days which, in combination with considerable dry air aloft, should cause some weakening. Later tomorrow, a slow weakening trend should begin and continue through 48 hours, although not weakening as much as shown in the past advisory. This can't be considered a high-confidence prediction in light of what Florence has done so far. On Friday, an upper-level low could cut off to the south of the cyclone, which would lessen the shear near Florence, and the hurricane should be moving over steadily increasing SSTs. Restrengthening is forecast at long range, and it wouldn't be surprising if the new NHC prediction turns out to be too low. It is best to be conservative, however, since the track uncertainty is increasing by the end of the forecast.

Hurricane Florence Discussion Number 27

NWS National Hurricane Center Miami FL 1100 PM AST Wed Sep 05 2018

AL062018

It appears that southwesterly shear is finally affecting Florence. The cloud pattern has become asymmetric this evening, with the northeastern quadrant growing at the expense of the southwestern one, along with warming cloud tops noted across the central dense overcast. Satellite intensity estimates are a bit lower than before, so the initial wind speed is reduced to 110 kt.

The current shear is forecast to persist by the global models during the next day or two until an upper-level low cuts off to south of Florence, which will likely reduce the shear. This, in combination with much warmer waters in the path of the hurricane, should set the stage for restrengthening. At long range, a rather large upper-level anticyclone is forecast to form near Florence, which would provide ample opportunity for the hurricane to regain its former strength and grow in size. Thus, the official forecast shows slow weakening in response to the initial shear, then levels off, with a significant increase in strength predicted by day 5. This solution is very close to the previous NHC advisory, but not quite as high as the HWRF and HMON models at long range.

Florence has been moving more to the right during the past several hours, likely due to the vortex attempting to stay vertically aligned in the face of the southwesterly shear, but a longer-term motion is 310 degrees at 10 kt. A mid-level ridge is forecast to strengthen to the north and northwest of Florence, causing the hurricane to turn west-northwestward by Friday and even westward by the weekend. It appears that a mid-latitude trough over the northwestern Atlantic in a few days will likely miss Florence, with the only perceivable effects on the hurricane being a decrease in forward speed. The net result is that the model guidance continues to trend westward at long range, and the official forecast follows suit, lying just north of the model consensus in deference to the ECMWF deterministic model and ensemble mean.

It should be noted that there is still considerable model ensemble spread for Florence's track beyond day 5. Given the large uncertainty at these time ranges, it is far too soon to speculate what, if any, impacts Florence may have on the U.S. East Coast next week. Regardless of Florence's eventual track, large swells emanating from the hurricane will reach Bermuda beginning on Friday, resulting in life-threatening surf and rip currents on the island. Swells from Florence could also reach the U.S. East Coast by early next week.

SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...22.0N 45.7W
ABOUT 1160 MI...1865 KM ENE OF THE NORTHERN LEEWARD ISLANDS
ABOUT 1370 MI...2205 KM ESE OF BERMUDA
MAXIMUM SUSTAINED WINDS...125 MPH...205 KM/H
PRESENT MOVEMENT...NW OR 305 DEGREES AT 13 MPH...20 KM/H
MINIMUM CENTRAL PRESSURE...957 MB...28.26 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the eye of Hurricane Florence was located near latitude 22.0 North, longitude 45.7 West. Florence is moving toward the northwest near 13 mph (20 km/h), and this general motion is expected to continue through tonight. A turn toward the west-northwest with a decrease in forward speed is forecast on Thursday, followed by a turn back toward the northwest early next week.

Satellite images indicate that maximum sustained winds have increased to near 125 mph (205 km/h) with higher gusts. Florence is a category 3 hurricane on the Saffir-Simpson Hurricane Wind Scale. Some weakening is possible during the next few days, but Florence is expected to remain a strong hurricane through early next week. Hurricane-force winds extend outward up to 15 miles (30 km) from the center, and tropical-storm-force winds extend outward up to 90 miles (150 km).

The estimated minimum central pressure is 957 mb (28.26 inches).

HAZARDS AFFECTING LAND

None.

...FLORENCE STRENGTHENS INTO A CATEGORY 4 HURRICANE...

SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...22.7N 46.6W

ABOUT 1110 MI...1790 KM ENE OF THE NORTHERN LEEWARD ISLANDS

ABOUT 1295 MI...2080 KM ESE OF BERMUDA

MAXIMUM SUSTAINED WINDS...130 MPH...215 KM/H

PRESENT MOVEMENT...NW OR 305 DEGREES AT 13 MPH...20 KM/H

MINIMUM CENTRAL PRESSURE...953 MB...28.15 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the eye of Hurricane Florence was located near latitude 22.7 North, longitude 46.6 West. Florence is moving toward the northwest near 13 mph (20 km/h), and this general motion is expected to continue through Thursday. A turn toward the west-northwest with a decrease in forward speed is forecast to begin Thursday night, followed by a turn back toward the northwest early next week.

Maximum sustained winds have increased to near 130 mph (215 km/h) with higher gusts. Florence is now a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Some weakening is forecast during the next couple of days, but Florence is expected to remain a powerful hurricane through early next week.

Hurricane-force winds extend outward up to 15 miles (30 km) from the center and tropical-storm-force winds extend outward up to 90 miles (150 km).

The estimated minimum central pressure is 953 mb (28.15 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence will begin to affect Bermuda on Friday. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

BULLETIN

Hurricane Florence Advisory Number 27

NWS National Hurricane Center Miami FL 1100 PM AST Wed Sep 05 2018
AL062018

...FLORENCE SHOULD REMAIN A POWERFUL HURRICANE FOR SEVERAL MORE
DAYS...

SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...23.4N 47.2W

ABOUT 1085 MI...1750 KM ENE OF THE NORTHERN LEEWARD ISLANDS

ABOUT 1235 MI...1990 KM ESE OF BERMUDA

MAXIMUM SUSTAINED WINDS...125 MPH...205 KM/H

PRESENT MOVEMENT...NW OR 310 DEGREES AT 10 MPH...17 KM/H

MINIMUM CENTRAL PRESSURE...956 MB...28.23 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Hurricane Florence was located near latitude 23.4 North, longitude 47.2 West. Florence is moving toward the northwest near 10 mph (17 km/h), and this general motion is expected to continue through Thursday. A turn toward the west-northwest with a decrease in forward speed is forecast to begin Thursday night, followed by a turn toward the west by the weekend. Maximum sustained winds have decreased to near 125 mph (205 km/h) with higher gusts. Florence is a category 3 hurricane on the Saffir-Simpson Hurricane Wind Scale. Some gradual weakening is forecast during the next 48 hours, with restrengthening possible over the weekend.

Hurricane-force winds extend outward up to 15 miles (30 km) from the center and tropical-storm-force winds extend outward up to 90 miles (150 km).

The estimated minimum central pressure is 956 mb (28.23 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence will begin to affect Bermuda on Friday. These swells are likely to cause life-threatening surf and

rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 500 AM AST.

Hurricane Florence Discussion Number 24

NWS National Hurricane Center Miami FL 500 AM AST Wed Sep 05 2018
AL062018

Conventional satellite enhanced BD-curve infrared imagery and a 0511 UTC GMI color composite microwave pass reveal improved inner core structure with impressive outer banding over the eastern semicircle. Dvorak intensity estimates have again increased, and the initial intensity is once more increased to 90 kt, which also agrees with the latest SATCON analysis.

This intensity forecast is still a bit murky. The deterministic models show increasing southwesterly vertical shear and a less than favorable mid-tropospheric thermodynamic environment affecting the tropical cyclone over the next 48 hours. This less-than-conducive environment should induce weakening during this time frame.

Thereafter, and through the remaining forecast, most of the models show a mid- to upper-level low developing to the south of Florence in the base of the mid- Atlantic deep-layer trough, which should promote a somewhat more favorable diffluent upper wind pattern. This more conducive upper wind pattern, and increasing sea surface temperatures, is expected to cause Florence to restrengthen. The NHC forecast is a little bit higher than the previous one between the 48 and 96 hr periods to agree more with the IVCN and NOAA-HCCA consensus forecasts.

Florence is estimated to be moving northwestward, or 305/11 kt, which appears to be a temporary trochoidal eyewall wobble. A turn back toward the west-northwest is expected later today, and this general motion is expected to continue through day 4 while the hurricane is steered by the southwestern periphery of the subtropical ridge. By the end of the forecast period, Florence is expected to turn northwestward and slow down as it enters a break in the ridge. The ECMWF model track forecast has shifted significantly toward the left this evening, closer to the other global models and their ensemble means, indicating less steering influence from the predicted growing weakness in the subtropical ridge. Subsequently, an adjustment to the left of the previous advisory, beyond 48 hours, was made in order to nudge closer to the guidance suite and the consensus models.

Hurricane Florence Discussion Number 25

NWS National Hurricane Center Miami FL 1100 AM AST Wed Sep 05 2018
AL062018

Remarkably, Florence has continued to strengthen. The hurricane has a compact central dense overcast with cold cloud tops completely encircling a clear, well-defined eye. With the improved structure, subjective Dvorak estimates have increased to T5.5/102 kt from TAFB and T6.0/115 kt from SAB, while the latest objective UW-CIMSS ADT estimate is T5.8/110 kt. The initial intensity is therefore set at 110 kt as a blend of these numbers, with Florence having become a major hurricane earlier this morning.

Given the estimated maximum winds, Florence has been rapidly intensifying since yesterday, an event that was not foreseen by any intensity models, nor forecasters. Diagnostics from the SHIPS model and UW-CIMSS shear analyses have been consistently showing southwesterly shear of 20-25 kt in the vicinity of Florence, but it is possible that those schemes are averaging over a larger area than might be reasonable given the hurricane's small size. Florence has apparently been able to find a small pocket of relatively low shear, and with waters becoming progressively warmer, the hurricane has strengthened significantly more than anticipated. This makes the intensity forecast incredibly uncertain. SHIPS actually shows the shear increasing over the next 24 hours, but global model fields suggest that the hurricane may still be able to continue within the protected pocket of lower shear for the next several days. As a result, the NHC official forecast keeps Florence's intensity well above the available guidance, which all show the hurricane weakening over the next day or two. The new NHC prediction follows this trend and also shows some weakening, but this is a low-confidence forecast. Either way, Florence is expected to remain a hurricane throughout the 5-day period. The track forecast also has its challenges. The initial motion estimate is northwestward, or 305/11 kt. It now appears that stronger upper-level ridging may take shape to the north of Florence over the next few days, forcing the hurricane to turn back toward the west-northwest from 36-72 hours. After 72 hours, a break in the ridge should allow Florence to turn back toward the northwest, but the bulk of the track models have trended westward since yesterday. In light of these trends, the NHC official track forecast has been shifted westward on days 4 and 5, but not quite as far as the various model consensus aids. It is worth stressing that there is still a significant amount of spread among the GFS and ECMWF ensemble members by the end of the forecast period, and just like the intensity forecast, the track forecast is of low confidence.

Hurricane Florence Advisory Number 24
NWS National Hurricane Center Miami FL 500 AM AST Wed Sep 05 2018
...FLORENCE A LITTLE STRONGER...
...MOVING OVER THE OPEN ATLANTIC...
AL062018
SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...21.4N 44.8W
ABOUT 1210 MI...1945 KM ENE OF THE NORTHERN LEEWARD ISLANDS
ABOUT 1440 MI...2315 KM ESE OF BERMUDA
MAXIMUM SUSTAINED WINDS...105 MPH...165 KM/H
PRESENT MOVEMENT...NW OR 305 DEGREES AT 13 MPH...20 KM/H
MINIMUM CENTRAL PRESSURE...976 MB...28.82 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.
DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Hurricane Florence was located near latitude 21.4 North, longitude 44.8 West. Florence is temporarily moving toward the northwest near 13 mph (20 km/h). A turn back toward the west-northwest is expected later today, and this general motion is expected to continue with Florence's forward speed decreasing by the weekend. Maximum sustained winds are near 105 mph (165 km/h) with higher gusts. A gradual weakening trend is forecast to begin tonight and continue through Friday. After that time, Florence is forecast to restrengthen through the weekend. Hurricane-force winds extend outward up to 15 miles (30 km) from the center and tropical-storm-force winds extend outward up to 90 miles (150 km).

The estimated minimum central pressure is 976 mb (28.82 inches).

HAZARDS AFFECTING LAND

None.

TTAA00 KNHC DDHHMM

Hurricane Florence Discussion Number 26

NWS National Hurricane Center Miami FL 500 PM AST Wed Sep 05 2018
AL062018

Florence has continued to intensify during the day, with colder cloud tops completely encircling a clearer eye. Both subjective and objective Dvorak estimates have unanimously increased to T6.0/115 kt, and on this basis, the initial intensity is raised to 115 kt, making Florence a category 4 hurricane.

Florence appears to be right along the southern edge of a zone of stronger vertical shear and continues to defy the intensity guidance, which has consistently been predicting weakening. That said, the last few satellite images indicate that the eye may be becoming slightly disrupted by the shear. Since the shear is anticipated to increase during the next day or so, gradual weakening is shown in the short-term official forecast, which lies along the upper end of the guidance through 48 hours. Beyond 48 hours, vertical shear is anticipated to weaken, which would allow Florence to intensify and potentially regain major hurricane status. However, Florence will need to thread the needle between areas of stronger shear for this to happen, and there is significant uncertainty in the intensity forecast. The new official intensity forecast is little changed from before except to adjust upward to account for the higher initial intensity.

The initial motion estimate remains northwestward, or 305/11 kt. Strong upper-level ridging is forecast to strengthen north of Florence over the next few days, forcing the hurricane to turn toward the west-northwest through about 48 hours. Track guidance is in good agreement during this period, and the official forecast is essentially an update to the previous one. Beyond day 2, a break forms in the ridge, which results in a weakening of the steering currents, a slowdown in Florence's forward speed, and a turn back

toward the northwest. The new official forecast is shifted south a bit on days 3-5 to account for recent model trends and is closest to the TVCN consensus.

It should be noted that there is considerable model ensemble spread and run-to-run variability for Florence's track beyond day 5. Given the large uncertainty at these time ranges, it is far too soon to speculate what, if any, impacts Florence may have on the U.S. East Coast next week. Regardless of Florence's eventual track, large swells emanating from the hurricane will reach Bermuda beginning on Friday, resulting in life-threatening surf and rip currents on the island. Swells from Florence could also reach the U.S. East Coast by early next week.

FORECAST POSITIONS AND MAX WINDS

INIT 05/2100Z 22.7N 46.6W 115 KT 130 MPH

Hurricane Florence Advisory Number 28

NWS National Hurricane Center Miami FL 500 AM AST Thu Sep 06 2018

AL062018

...FLORENCE WEAKENING FOR NOW BUT STILL A STRONG HURRICANE...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...24.1N 47.9W

ABOUT 1060 MI...1705 KM ENE OF THE NORTHERN LEEWARD ISLANDS

ABOUT 1170 MI...1885 KM ESE OF BERMUDA

MAXIMUM SUSTAINED WINDS...115 MPH...185 KM/H

PRESENT MOVEMENT...NW OR 315 DEGREES AT 12 MPH...19 KM/H

MINIMUM CENTRAL PRESSURE...964 MB...28.47 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Hurricane Florence was located near latitude 24.1 North, longitude 47.9 West. Florence is moving toward the northwest near 12 mph (19 km/h). A turn toward the west-northwest with a decrease in forward speed is expected later today, followed by a turn toward the west by the weekend. Maximum sustained winds have decreased to near 115 mph (185 km/h) with higher gusts. Florence is a category 3 hurricane on the Saffir-Simpson Hurricane Wind Scale. Some additional weakening is forecast today, but Florence is expected to remain a strong hurricane for the next several days. Hurricane-force winds extend outward up to 15 miles (30 km) from the center and tropical-storm-force winds extend outward up to 90 miles (150 km).

The estimated minimum central pressure is 964 mb (28.47 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence will begin to affect Bermuda on Friday and will reach portions of the U.S. East Coast over the weekend. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

Hurricane Florence Discussion Number 29

NWS National Hurricane Center Miami FL 1100 AM AST Thu Sep 06 2018
AL062018

Vertical shear has increased since yesterday, which has caused a degradation of Florence's structure and a decrease in its maximum winds. The cloud-filled eye has been eroded over the past hour or so, and the deep convection is no longer symmetric, with the low-level circulation peeking out from under the higher clouds. Dvorak CI numbers from TAFB and SAB have fallen to T5.0-5.5 (90-100 kt), while the objective numbers from UW-CIMSS support 70-90 kt. The initial intensity is set at 90 kt, near the middle of this wide range of estimates.

The intensity forecast has been somewhat of a self-defeating prophecy due to the nuances of the environmental shear. Even though Florence was able to rapidly intensify yesterday in an area just south of a zone of strong shear, the hurricane's stronger-than-expected intensity caused it to move more poleward, into that stronger shear. Right now, shear analyses range anywhere from 25-30 kt, and the latest available guidance suggests that this level of shear should continue for another 12-24 hours. As a result, continued weakening is forecast over the next day or so. After 36 hours, Florence is likely to encounter an upper-level environment that is more conducive for reintensification. The NHC forecast is adjusted downward toward the newest consensus aids, especially during the first 48 hours, but it still shows Florence reaching major hurricane strength again by days 4 and 5.

Florence's forward motion has slowed just a little to 9 kt toward the northwest (315 degrees). A mid-level ridge is building to the north, which is likely to cause the hurricane to turn westward by 36 hours, with that motion continuing through about day 3. After that time, there is still considerable uncertainty in the evolution of the steering pattern over the western Atlantic, especially on day 4. On one hand, the GFS and HWRF dig a strong shortwave trough over Atlantic Canada by Monday, creating a break in the ridge which would allow Florence to turn northwestward. On the other hand, the ECMWF and UKMET both have weaker troughs and maintain stronger ridging over the northwestern Atlantic, allowing Florence to maintain a westward or west-northwestward course. All the models show a mid-level high over the western Atlantic by Tuesday. Due to typical biases among these models in the part of the Atlantic, we prefer to be between the GFS and ECMWF solutions at this time, which places the official NHC track forecast close to the TVCN multi-model consensus and just north of HCCA.

There is still considerable model ensemble spread for Florence's track beyond day 5. Given the large uncertainty at these time ranges, it is far too soon to speculate what, if any, impacts Florence may have on the U.S. East Coast next week. Regardless of Florence's eventual track, large swells emanating from the hurricane

will reach Bermuda beginning on Friday and portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.

Hurricane Florence Discussion Number 30

NWS National Hurricane Center Miami FL 500 PM AST Thu Sep 06 2018

AL062018

Vertical shear has taken its toll on Florence today as evidenced by a continued degradation of the overall cloud pattern. The circulation appears tilted, with the low-level center partially exposed to the southwest of the deep convection. Subjective and objective Dvorak Current Intensity (CI) numbers have fallen, and a blend of the various estimates supports an initial intensity of 70 kt.

The intensity forecast is relatively straightforward in the short-term as shear is expected to remain strong, which should continue Florence's weakening trend, potentially taking the system below hurricane strength. By 24 hours, vertical shear is forecast to decrease, and the SSTs gradually warm along the forecast track. Assuming the overall circulation remains intact, Florence shouldn't have any problems restrengthening beginning in a day or so. In fact, guidance suggests that Florence could once again become a major hurricane in 4 or 5 days. The new NHC intensity forecast is essentially an update of the previous one, and is only adjusted to account for recent trends. Largely, the official forecast is close to the various consensus aids.

Owing to the degraded structure and tilted nature of the system, Florence has wobbled a bit to the west, but the longer-term motion estimate is 305/09. Low- to mid-level ridging should cause Florence to turn toward the west-northwest and west between 12-48 hours while the cyclone recovers from the strong shear. Thereafter,

Florence is anticipated to become a deep cyclone again, but an even stronger ridge should maintain the west-northwestward motion, at a faster speed, through day 5. The ridge is forecast to be sufficiently strong such that some track models show a motion just south of due west during the next 12-36 hours. Beyond day 3, the track forecast becomes increasingly uncertain due to differing evolutions of the steering pattern over the western Atlantic. While all of the global models show a progressive trough eroding the ridge, they differ in the strength of the trough and the ridge to the north of Florida. These differences result in a great deal of bifurcation in the track guidance, especially among global model ensemble members, at the end of the forecast period. In such situations, prudence suggests a reliance on continuity, and the new official NHC track forecast is shifted only slightly south towards the TVCN multi-model consensus and HCCA. It is important to note that deterministic track models in these types of situations often display considerable run-to-run changes, and the uncertainty in this forecast remains larger than normal.

Key Messages:

1. Regardless of Florence's eventual track, large swells will begin to affect Bermuda on Friday and portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.
2. There is still very large uncertainty in Florence's track beyond day 5, and it is too soon to determine what, if any, other impacts Florence could have on the U.S. East Coast next week.
3. Since we are near the peak of hurricane season, this is a good time for everyone who lives in a hurricane-prone area to ensure they have their hurricane plan in place.

Tropical Storm FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 31

NWS National Hurricane Center Miami FL 1100 PM AST Thu Sep 06 2018

AL062018

Deep convection near the center of Florence has continued to decrease during the past several hours, and the overall cloud pattern remains elongated from southwest to northeast. The latest Dvorak estimates and a recent scatterometer pass suggest that Florence is no longer a hurricane, and the initial wind speed is set to 60 kt.

Some further weakening is anticipated since the shear isn't forecast to change much in the short term. However, all of the global models show a significant reduction of shear during the next several days, especially later this weekend. In combination with waters warming to near 29C, these conditions should promote strengthening into a hurricane again in a day or two and a major hurricane by early next week. The intensity guidance is higher than the last cycle at long range, which is hard to argue with considering the large upper-level anticyclone forecast in the vicinity of Florence. The NHC intensity forecast follows the trend of the previous prediction, a bit elevated from the previous forecast at days 4 and 5, although still below the intensity guidance.

A recent scatterometer pass indicates that Florence has slowed down and turned left, estimated at 290/6. A narrow ridge over the subtropical Atlantic Ocean should continue to turn the storm westward overnight, albeit traveling at a relatively slow pace due to the strength of the ridge. This ridge is forecast to strengthen at long range, steering Florence faster to the west-northwest over the western Atlantic Ocean. Except for the UKMET, most of the historically reliable guidance is in reasonable agreement on this scenario, which is a bit surprising given the recent trials and tribulations from the guidance suite. The models continue to shift westward at long range, however, owing to differences on the strength and position of that ridge, and the official NHC track forecast is moved in that direction.

Key Messages:

1. Regardless of Florence's eventual track, large swells will begin to affect Bermuda on Friday and portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.
2. There is still very large uncertainty in Florence's track beyond day 5, and it is too soon to determine what, if any, other impacts Florence could have on the U.S. East Coast next week.
3. Since we are near the peak of hurricane season, this is a good time for everyone who lives in a hurricane-prone area to ensure they have their hurricane plan in place.

TTAA00 KNHC DDHHMM

Hurricane Florence Discussion Number 28

NWS National Hurricane Center Miami FL 500 AM AST Thu Sep 06 2018

AL062018

Southwesterly shear continues to affect Florence. Since the last advisory, the cloud pattern has become more asymmetric, and cloud tops surrounding the ragged eye have warmed. AMSR imagery around 0430 UTC indicated that the hurricane's eye is tilted slightly southwest to northeast with height, but the low- to mid-level inner-core was mostly intact. Based on an average of Final-T and CI numbers from TAFB and SAB, the initial intensity has been lowered to 100 kt, and objective estimates are even lower.

Given the wind shear and current appearance of Florence, additional weakening in the short-term seems likely, and all of the intensity guidance agrees. From 24-72 h, the spread increases with the statistical models generally showing continued gradual weakening for another day or two, while the dynamical models show little change or slight restrengthening. By day 5, all of the guidance calls for Florence to restrengthen. The guidance envelope and consensus is lower with this model cycle, but the NHC intensity forecast has only been adjusted slightly lower, mainly in the first 72 h of the forecast. The official forecast is now a little above the IVCN intensity consensus and HCCA at most forecast hours, generally favoring the stronger solution of the dynamical models.

Florence has continued to track northwestward, and the initial motion is 315/10 kt. The cyclone is still forecast to gradually turn westward over the next 48 h, in response to a building mid-level ridge to its north. Beyond that time, a mid-latitude trough over the northwestern Atlantic could create enough of a weakness in the ridge to steer the hurricane farther north, closer to Bermuda, as shown by the latest GFS. However, the ECMWF and

UKMET suggest that the ridge will not be significantly affected, and Florence will move more westward. The ensembles from the GFS and ECMWF do not clearly favor one solution over another, and in fact many members track Florence somewhere in-between. While little change was made to the previous forecast and the new official track forecast remains close to the various consensus aids, the model spread has increased and confidence in the forecast is low. There is still considerable model ensemble spread for Florence's track beyond day 5. Given the large uncertainty at these time ranges, it is far too soon to speculate what, if any, impacts Florence may have on the U.S. East Coast next week. Regardless of Florence's eventual track, large swells emanating from the hurricane will reach Bermuda beginning on Friday and portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.

BULLETIN

Tropical Storm Florence Advisory Number 31

NWS National Hurricane Center Miami FL 1100 PM AST Thu Sep 06 2018

...FLORENCE EXPECTED TO REINTENSIFY ON FRIDAY...

AL062018

SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...25.1N 49.8W

ABOUT 975 MI...1570 KM ENE OF THE NORTHERN LEEWARD ISLANDS

ABOUT 1035 MI...1665 KM ESE OF BERMUDA

MAXIMUM SUSTAINED WINDS...70 MPH...110 KM/H

PRESENT MOVEMENT...WNW OR 290 DEGREES AT 7 MPH...11 KM/H

MINIMUM CENTRAL PRESSURE...993 MB...29.33 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Tropical Storm Florence was located near latitude 25.1 North, longitude 49.8 West. Florence is moving toward the west-northwest near 7 mph (11 km/h), and a turn toward the west is forecast on Friday. A slow westward motion is expected over the weekend, with a possible turn toward the west-northwest on Sunday.

Maximum sustained winds are near 70 mph (110 km/h) with higher gusts. Little change in strength is anticipated on Friday, followed by a slow increase in wind speed over the weekend.

Tropical-storm-force winds extend outward up to 115 miles (185 km) from the center.

The estimated minimum central pressure is 993 mb (29.33 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence will begin to affect Bermuda on Friday and will reach portions of the U.S. East Coast over the weekend. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 500 AM AST.

Hurricane Florence Advisory Number 30

NWS National Hurricane Center Miami FL 500 PM AST Thu Sep 06 2018

...FLORENCE CLINGING TO HURRICANE STATUS...

...EXPECTED TO REINTENSIFY ON FRIDAY...

AL062018

SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...25.0N 49.6W

ABOUT 985 MI...1585 KM ENE OF THE NORTHERN LEEWARD ISLANDS

ABOUT 1050 MI...1685 KM ESE OF BERMUDA

MAXIMUM SUSTAINED WINDS...80 MPH...130 KM/H

PRESENT MOVEMENT...NW OR 305 DEGREES AT 10 MPH...17 KM/H

MINIMUM CENTRAL PRESSURE...989 MB...29.21 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the center of Hurricane Florence was located near latitude 25.0 North, longitude 49.6 West. Florence is moving toward the northwest near 10 mph (17 km/h), and a turn towards the west is expected tomorrow. A westward to west-northwestward motion should continue into early next week. Maximum sustained winds are near 80 mph (130 km/h) with higher gusts. Continued weakening is forecast during the next day or so followed by restrengthening late Friday into this weekend. Hurricane-force winds extend outward up to 15 miles (30 km) from the center and tropical-storm-force winds extend outward up to 90 miles (150 km).

The estimated minimum central pressure is 989 mb (29.21 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence will begin to affect Bermuda on Friday and will reach portions of the U.S. East Coast over the weekend. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

BULLETIN

Hurricane Florence Advisory Number 29

NWS National Hurricane Center Miami FL 1100 AM AST Thu Sep 06 2018

...FLORENCE WEAKENS FURTHER...

AL062018

SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...24.6N 48.6W

ABOUT 1030 MI...1660 KM ENE OF THE NORTHERN LEEWARD ISLANDS

ABOUT 1115 MI...1795 KM ESE OF BERMUDA

MAXIMUM SUSTAINED WINDS...105 MPH...165 KM/H

PRESENT MOVEMENT...NW OR 315 DEGREES AT 10 MPH...17 KM/H

MINIMUM CENTRAL PRESSURE...975 MB...28.80 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the center of Hurricane Florence was located near latitude 24.6 North, longitude 48.6 West. Florence is moving toward the northwest near 10 mph (17 km/h). A turn toward the west-northwest and west with a decrease in forward speed is expected through Saturday. Florence may begin to move faster toward the west-northwest over the western Atlantic early next week. Maximum sustained winds have decreased to near 105 mph (165 km/h) with higher gusts. Additional weakening is forecast during the next day or two. However, Florence is expected to remain a hurricane and likely reintensify over the weekend. Hurricane-force winds extend outward up to 15 miles (30 km) from the center, and tropical-storm-force winds extend outward up to 90 miles (150 km).

The estimated minimum central pressure is 975 mb (28.80 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence will begin to affect Bermuda on Friday and will reach portions of the U.S. East Coast over the weekend. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 500 PM AST.

Tropical Storm Florence Discussion Number 35

NWS National Hurricane Center Miami FL 1100 PM AST Fri Sep 07 2018

AL062018

Florence remains a sheared tropical cyclone. Satellite images indicate that the low-level center is partially exposed on the southwesterly edge of a large convective mass, with the overall circulation somewhat elongated from southwest to northeast. A blend of the latest Dvorak wind speed estimates from TAFB/SAB and the CIMSS SATCON gives a value of 50 kt for this advisory. While the winds at 200 mb are already from an easterly direction near the center of Florence, there is significant shear from northwesterly winds from 300-500 mb, undercutting the outflow layer. This shear is forecast to relax by the global models over the next 36 hours as an anticyclone builds to the north of the storm, which should promote some strengthening by Sunday. After 48 hours, the deep-layer flow becomes easterly near the cyclone, with very little shear while the system is over very warm waters. This pattern favors significant intensification, and most of the guidance brings Florence back to a category 4 hurricane in 4 or 5 days. The intensity forecast is very similar to the last one, and is raised slightly at days 3 and 4 to come into better agreement with the guidance. It is interesting to note that even with a lower initial intensity, the guidance is higher than the last cycle, which speaks to the strength of the signal for intensification in the long range. The initial motion estimate is 265 degrees at 6 kt. Florence is expected to continue moving slowly westward for the next 48 hours under the influence of a weak mid-level ridge over the western Atlantic. By days 4 and 5, an exceptionally strong blocking ridge is forecast to develop between Bermuda and the Northeast U.S. and build westward, keeping Florence on a west-northwestward trajectory with a notable increase in forward speed by the end of the forecast period. It feels like a broken record to mention that the overall guidance envelope keeps shifting southwestward, and the official forecast is moved in that direction. Unfortunately with such a large well-defined steering current from the ridge becoming likely, the extended-range risk to the United States keeps rising, which is confirmed by the majority of the latest ensemble guidance.

Key Messages:

1. Regardless of Florence's eventual track, large swells are affecting Bermuda and will begin to affect portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.
2. The risk of other direct impacts associated with Florence along the U.S. East Coast next week has increased. However, there is still very large uncertainty in model forecasts of Florence's track beyond day 5, making it too soon to determine the exact location, magnitude, and timing of these impacts. Interests near and along the U.S. East Coast should monitor the progress of Florence through the weekend and ensure they have their hurricane plans in place.

Tropical Storm FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 34

NWS National Hurricane Center Miami FL 500 PM AST Fri Sep 07 2018
AL062018

Little has changed with Florence's structure during the day. The low-level center is located on the southwestern side of the deep convection due to moderate to strong southwesterly shear, and satellite intensity estimates are essentially the same from this morning. Therefore, the estimated maximum winds remain 55 kt.

NOAA is scheduled to conduct a research mission with the P-3 aircraft tomorrow, which should provide some useful wind data and give us a better handle on the cyclone's intensity.

Vertical shear is still expected to gradually decrease over the next day or two, likely reaching values of 10 kt or less by 48 hours. During this period, Florence should become more vertically stacked, which would allow for some reintensification, possibly back to hurricane strength within 36-48 hours. After 48 hours, the shear is expected to remain generally low, and oceanic heat content values will increase significantly as Florence moves over the waters between Bermuda and the northern Leeward Islands. This is a classic recipe for a quick intensification trend, and Florence is expected to become a major hurricane by days 4 and 5. The generally skillful HCCA, Florida State Superensemble, and ICON intensity consensus are all near 110-115 kt by day 5, and because of this, no notable changes were required from the previous official intensity forecast.

Florence has been moving south of due west (260 degrees) at 7 kt, located south of a low- to mid-level ridge. The cyclone is expected to continue moving generally westward for the next 48 hours while it remains sheared. As Florence begins to strengthen and become vertically stacked after 48 hours, it should begin to turn west-northwestward, steered by a deeper flow regime. By days 4 and 5, an exceptionally strong blocking ridge is forecast to

develop between Bermuda and the Northeast U.S., keeping Florence on a west-northwestward trajectory with an increase in forward speed by the end of the forecast period. A slight southwestward adjustment was made to the NHC forecast to account for Florence's initial motion and a slight shift in the overall guidance envelope. For most of the forecast period, the official forecast is close to a blend of the GFS and ECMWF.

Key Messages:

1. Regardless of Florence's eventual track, large swells are affecting Bermuda and will begin to affect portions of the U.S. Coast this weekend, resulting in life-threatening surf and rip currents.

2. The risk of other direct impacts associated with Florence along the U.S. East Coast next week has increased. However, there is still very large uncertainty in model forecasts of Florence's track beyond day 5, making it too soon to determine the exact location, magnitude, and timing of these impacts. Interests near and along the U.S. East Coast should monitor the progress of Florence through the weekend and ensure they have their hurricane plans in place.

BULLETIN

Tropical Storm Florence Advisory Number 32
NWS National Hurricane Center Miami FL 500 AM AST Fri Sep 07 2018
AL062018

...FLORENCE WEAKENS A LITTLE MORE BUT STILL EXPECTED TO
RE-STRENGTHEN OVER THE WEEKEND...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...25.1N 50.7W

ABOUT 925 MI...1490 KM ENE OF THE NORTHERN LEEWARD ISLANDS

ABOUT 985 MI...1590 KM ESE OF BERMUDA
MAXIMUM SUSTAINED WINDS...65 MPH...100 KM/H
PRESENT MOVEMENT...W OR 275 DEGREES AT 7 MPH...11 KM/H
MINIMUM CENTRAL PRESSURE...996 MB...29.42 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Tropical Storm Florence located near latitude 25.1 North, longitude 50.7 West. Florence moving toward the west near 7 mph (11 km/h). This general motion will likely continue for the next couple of days. A turn toward the west-northwest is expected by the end of the weekend.

was

is

Maximum sustained winds have decreased to near 65 mph (100 km/h) with higher gusts. Little change in intensity is expected today. However, Florence is forecast to restrengthen and become a hurricane again over the weekend.

Tropical-storm-force winds extend outward up to 140 miles (220 km) from the center.

The estimated minimum central pressure is 996 mb (29.42 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence will begin to affect Bermuda later today and will reach portions of the U.S. East Coast over the weekend. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 1100 AM AST.

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 33

NWS National Hurricane Center Miami FL 1100 AM AST Fri Sep 07 2018

AL062018

Moderate to strong southwesterly shear continues to affect Florence, but visible and microwave satellite images indicate that the cyclone is maintaining a vigorous, but tilted, circulation.

A mid-level eye feature is noted in both types of satellite imagery, but the low-level center still appears displaced to the southwest. Subjective and objective satellite intensity estimates have stopped falling--and some have even begun to increase a bit again--so the initial intensity is being held at 55 kt.

The shear over Florence has likely reached its maximum and is expected to decrease below 20 kt in 6-12 hours and then decrease to 10 kt or less in 36 hours. All the while, sea surface temperatures will be gradually increasing to between 28-29C, and perhaps more importantly, oceanic heat content values will double in 3-4 days. It may take the cyclone some time to gather itself once the shear abates, but once it becomes vertically stacked again, the intensity is likely to increase significantly. The guidance is in agreement on this scenario, and Florence is likely to re-attain hurricane status in about 48 hours and then potentially major hurricane strength by days 4-5. The new official forecast is fairly similar to the previous one, generally close to the ICON intensity consensus and slightly below the HCCA model on days 4 and 5.

Florence is moving westward, or 270/7 kt, to the south of the eastern periphery of a subtropical ridge extending east of the Mid-Atlantic United States. The global model guidance is actually in fairly good agreement on the general evolution of the steering pattern around Florence through day 5. While it remains a tilted cyclone, Florence is expected to continue moving westward for the next 48 hours. After that time, a break in the ridge should allow Florence to turn west-northwestward over the southwestern Atlantic. A new mid-level ridge is expected to develop over the western Atlantic on days 4-5, but the position of that high will play a big role regarding how much Florence may turn by the end of the forecast period. Only a slight southward nudge of forecast track was required on this cycle, keeping the NHC prediction between the GFS and ECMWF solutions.

Key Messages:

1. Regardless of Florence's eventual track, large swells will begin to affect Bermuda later today and portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.
2. The risk of other direct impacts associated with Florence along the U.S. East Coast next week has increased. However, there is still very large uncertainty in model forecasts of Florence's track beyond day 5, making it too soon to determine the exact location, magnitude, and timing of these impacts. Interests near and along the U.S. East Coast should monitor the progress of Florence through the weekend and ensure they have their hurricane plans in place.

TROPICAL STORM FLORENCE FORECAST/ADVISORY NUMBER 34

NWS NATIONAL HURRICANE CENTER MIAMI FL AL062018

2100 UTC FRI SEP 07 2018

THERE ARE NO COASTAL WATCHES OR WARNINGS IN EFFECT.

TROPICAL STORM CENTER LOCATED NEAR 24.8N 52.5W AT 07/2100Z

POSITION ACCURATE WITHIN 20 NM

PRESENT MOVEMENT TOWARD THE WEST OR 260 DEGREES AT 7 KT

ESTIMATED MINIMUM CENTRAL PRESSURE 996 MB

MAX SUSTAINED WINDS 55 KT WITH GUSTS TO 65 KT.

50 KT..... 30NE 0SE 0SW 30NW.

34 KT.....100NE 50SE 20SW 100NW.

12 FT SEAS..180NE 90SE 120SW 210NW.

WINDS AND SEAS VARY GREATLY IN EACH QUADRANT. RADII IN NAUTICAL
MILES ARE THE LARGEST RADII EXPECTED ANYWHERE IN THAT QUADRANT.

REPEAT...CENTER LOCATED NEAR 24.8N 52.5W AT 07/2100Z

AT 07/1800Z CENTER WAS LOCATED NEAR 24.8N 52.2W

FORECAST VALID 08/0600Z 24.6N 53.5W

MAX WIND 55 KT...GUSTS 65 KT.

50 KT... 30NE 0SE 0SW 30NW.

34 KT...100NE 50SE 20SW 90NW.

FORECAST VALID 08/1800Z 24.6N 54.7W

MAX WIND 55 KT...GUSTS 65 KT.

50 KT... 30NE 20SE 0SW 30NW.

34 KT... 90NE 60SE 30SW 90NW.

FORECAST VALID 09/0600Z 24.6N 55.8W

MAX WIND 60 KT...GUSTS 75 KT.

50 KT... 40NE 30SE 20SW 30NW.

34 KT... 90NE 70SE 40SW 90NW.

FORECAST VALID 09/1800Z 24.8N 57.0W

MAX WIND 70 KT...GUSTS 85 KT.

64 KT... 20NE 15SE 0SW 15NW.

50 KT... 40NE 30SE 20SW 30NW.

34 KT...100NE 80SE 50SW 90NW.

FORECAST VALID 10/1800Z 25.8N 60.9W

MAX WIND 90 KT...GUSTS 110 KT.
50 KT... 50NE 40SE 30SW 40NW.
34 KT...120NE 90SE 70SW 100NW.
EXTENDED OUTLOOK. NOTE...ERRORS FOR TRACK HAVE AVERAGED NEAR 150 NM
ON DAY 4 AND 175 NM ON DAY 5...AND FOR INTENSITY NEAR 15 KT EACH DAY
OUTLOOK VALID 11/1800Z 27.5N 67.0W
MAX WIND 110 KT...GUSTS 135 KT.
OUTLOOK VALID 12/1800Z 30.5N 73.0W
MAX WIND 115 KT...GUSTS 140 KT.
REQUEST FOR 3 HOURLY SHIP REPORTS WITHIN 300 MILES OF 24.8N 52.5W
NEXT ADVISORY AT 08/0300Z

Tropical Storm FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 32

NWS National Hurricane Center Miami FL 500 AM AST Fri Sep 07 2018
AL062018

Florence's structure continues to be negatively affected by strong southwesterly shear. Cloud tops have generally warmed over the past 6 hours, and recent microwave data show that the low-level circulation center of Florence is displaced nearly 20 nmi to the southwest of the mid-level center. Satellite intensity estimates have decreased since last night, and now support an initial intensity of 55 kt.

Based on GFS and ECMWF SHIPS diagnostic output, the southwesterly shear is near its peak now, and should gradually decrease over the next 24 to 36 h. All of the intensity guidance shows little change in intensity through that time. From 48 h onward, a low shear/warm SST environment should allow the tropical storm to re-strengthen. However, the extent and timing of the strengthening varies greatly from model to model, with the dynamical models generally showing more intensification, and sooner, than the statistical models. As has been the case for most of Florence's existence thus far,

confidence in the intensity forecast, especially beyond 36 h, is low. The new official forecast is a little lower than the previous advisory for the first 48 h, but close to it after that, and lies between the more aggressive HCCA and less aggressive IVCN consensus aids.

Nighttime Proxy-Vis and earlier microwave imagery indicate that Florence has turned westward, with an estimated initial motion of 275/6 kt. Most of the track guidance has shifted slightly toward the southwest, so the NHC track forecast has also been nudged in that direction. Over the next 3 days of the forecast, Florence should be steered generally westward, and then west-northwestward, by a mid-level ridge to its north. By days 4 and 5, a developing mid-latitude trough could create a weakness in this ridge and allow Florence to move more toward the northwest, but there is still considerable uncertainty in the global models and their ensembles regarding the strength of the ridge and if the aforementioned trough will have any notable impact on the track of Florence. The NHC forecast follows HCCA very closely, and is also near the middle of the large combined envelope of the GFS, UKMET, and ECMWF ensembles.

Key Messages:

1. Regardless of Florence's eventual track, large swells will begin to affect Bermuda later today and portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.
2. There is still very large uncertainty in Florence's track beyond day 5, and it is too soon to determine what, if any, other impacts Florence could have on the U.S. East Coast next week.
3. Since we are near the peak of hurricane season, this is a good time for everyone who lives in a hurricane-prone area to ensure they have their hurricane plan in place.

FORECAST POSITIONS AND MAX WINDS

ZCZC MIATCPAT1 ALL
TTAA00 KNHC DDHHMM
BULLETIN

Tropical Storm Florence Advisory Number 35
NWS National Hurricane Center Miami FL 1100 PM AST Fri Sep 07 2018
AL062018

...FLORENCE FORECAST TO RESTRENGTHEN LATER THIS WEEKEND...
SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...24.8N 53.2W
ABOUT 780 MI...1260 KM NE OF THE NORTHERN LEEWARD ISLANDS
ABOUT 875 MI...1405 KM ESE OF BERMUDA
MAXIMUM SUSTAINED WINDS...60 MPH...95 KM/H
PRESENT MOVEMENT...W OR 265 DEGREES AT 7 MPH...11 KM/H
MINIMUM CENTRAL PRESSURE...999 MB...29.50 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.
DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Tropical Storm Florence was located near latitude 24.8 North, longitude 53.2 West. Florence is moving toward the west near 7 mph (11 km/h), and this general motion is expected to continue for the next couple of days. A west-northwestward motion with an increase in forward speed is expected during the early-to-middle part of next week. On the forecast track, the center of Florence will move over the waters of the southwestern Atlantic Ocean through Wednesday. Maximum sustained winds have decreased to near 60 mph (95 km/h) with higher gusts. Little change in intensity is expected during the next day or so, but restrengthening is forecast over the weekend. Florence is forecast to become a hurricane again Sunday and a major hurricane early next week.

Tropical-storm-force winds extend outward up to 115 miles (185 km) from the center.

The estimated minimum central pressure is 999 mb (29.50 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and will reach portions of the U.S. East Coast over the weekend. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 500 AM AST.

Tropical Storm FLORENCE

ZCZC MIATCPAT1 ALL

TTAA00 KNHC DDHHMM

BULLETIN

Tropical Storm Florence Advisory Number 37

NWS National Hurricane Center Miami FL 1100 AM AST Sat Sep 08 2018
AL062018

...FLORENCE BECOMING BETTER ORGANIZED...

...EXPECTED TO STRENGTHEN TO A HURRICANE TONIGHT...

SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...24.5N 54.3W

ABOUT 835 MI...1340 KM SE OF BERMUDA

ABOUT 715 MI...1150 KM NE OF THE NORTHERN LEEWARD ISLANDS

MAXIMUM SUSTAINED WINDS...65 MPH...100 KM/H

PRESENT MOVEMENT...W OR 265 DEGREES AT 7 MPH...11 KM/H

MINIMUM CENTRAL PRESSURE...995 MB...29.39 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the center of Tropical Storm Florence was located near latitude 24.5 North, longitude 54.3 West. Florence is moving toward the west near 7 mph (11 km/h), and this general motion is expected to continue during the next couple of days. A west-northwestward to northwestward motion with an increase in forward speed is expected by the middle of next week. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the southeastern U.S. coast on Thursday.

Maximum sustained winds remain near 65 mph (100 km/h) with higher gusts, but Florence is likely to restrengthen to a hurricane by tonight. Rapid intensification is expected to start on Sunday, and Florence is forecast to be a major hurricane by Tuesday.

Tropical-storm-force winds extend outward up to 140 miles (220 km) from the center.

The estimated minimum central pressure is 995 mb (29.39 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and will reach portions of the U.S. East Coast over the weekend. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 500 PM AST.

BULLETIN

Tropical Storm Florence Advisory Number 38

NWS National Hurricane Center Miami FL 500 PM AST Sat Sep 08 2018

AL062018

...NOAA HURRICANE HUNTER FINDS FLORENCE A LITTLE STRONGER...

...FLORENCE EXPECTED TO BECOME A HURRICANE AGAIN TONIGHT OR EARLY
SUNDAY...

SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...24.6N 54.7W

ABOUT 810 MI...1305 KM SE OF BERMUDA

ABOUT 695 MI...1120 KM NE OF THE NORTHERN LEEWARD ISLANDS

MAXIMUM SUSTAINED WINDS...70 MPH...110 KM/H

PRESENT MOVEMENT...W OR 270 DEGREES AT 5 MPH...7 KM/H

MINIMUM CENTRAL PRESSURE...989 MB...29.21 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the center of Tropical Storm Florence was located near latitude 24.6 North, longitude 54.7 West. Florence is moving toward the west near 5 mph (7 km/h). A west-northwestward to northwestward motion with an increase in forward speed is expected by the middle of next week. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the southeastern U.S. coast on Thursday.

Data from a NOAA Hurricane Hunter aircraft indicate that maximum sustained winds have increased to near 70 mph (110 km/h) with higher gusts. Florence is expected to become a hurricane tonight, and rapid intensification is likely to begin on Sunday. Florence could become a major hurricane by Monday.

Tropical-storm-force winds extend outward up to 125 miles (205 km) from the center.

Data from the NOAA aircraft indicate that the minimum central pressure is 989 mb (29.21 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and are beginning to reach portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current

conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 1100 PM AST.

Tropical Storm FLORENCE

ZCZC MIATCPAT1 ALL
TTAA00 KNHC DDHHMM
BULLETIN

Tropical Storm Florence Advisory Number 39

NWS National Hurricane Center Miami FL 1100 PM AST Sat Sep 08 2018
AL062018

...FLORENCE STILL MOVING SLOWLY...
...EXPECTED TO BECOME A HURRICANE AT ANY TIME SOON...
SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...24.6N 55.2W
ABOUT 790 MI...1270 KM SE OF BERMUDA
ABOUT 675 MI...1085 KM NE OF THE NORTHERN LEEWARD ISLANDS
MAXIMUM SUSTAINED WINDS...70 MPH...110 KM/H
PRESENT MOVEMENT...W OR 270 DEGREES AT 6 MPH...9 KM/H
MINIMUM CENTRAL PRESSURE...989 MB...29.21 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.
DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Tropical Storm Florence was located near latitude 24.6 North, longitude 55.2 West. Florence is moving toward the west near 6 mph (9 km/h). A west-northwestward to northwestward motion with an increase in forward speed is expected by the middle of next week. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the southeastern U.S. coast on Thursday. Maximum sustained winds remain near 70 mph (110 km/h) with higher gusts. Florence is expected to become a hurricane at any time soon and rapid intensification is likely to begin on Sunday. Florence is forecast to become a major hurricane by Monday. Tropical-storm-force winds extend outward up to 125 miles (205 km) from the center. The estimated minimum central pressure is 989 mb (29.21 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and are beginning to reach portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

Tropical Storm Florence Discussion Number 36

NWS National Hurricane Center Miami FL 500 AM AST Sat Sep 08 2018

AL062018

Although Florence remains a sheared tropical cyclone, satellite imagery during the past 6 h also indicates that the shear has started to abate somewhat, which has allowed the dense cirrus canopy to build back over the previously exposed low-level circulation center. Furthermore, deep convection with overshooting cloud tops near -80C and an abundance of lightning activity have developed very close to the center. Based on these data along with Dvorak intensity estimates of T3.5/55 kt from TAFB and SAB, the initial intensity has been raised to 55 kt.

The initial motion estimate is 265/8 kt. The mid-latitude flow across CONUS and the northern Atlantic is forecast to flatten out and become more zonal over the next 48 h or so, resulting in the development of a narrow east-west oriented ridge along 35/36N latitude. This large-scale feature is expected to steer Florence in a general westward direction during that time. By days 3-5, however, the flow across the central and western U.S. is forecast to buckle and become more meridional as a deep mid-/upper-level trough over the northeast Pacific pushes inland over the western U.S., causing downstream ridging over the northeastern U.S. and northwestern Atlantic. The global models agree on this general change in the synoptic-scale flow pattern, but they differ noticeably on where a downstream mid-/upper-level high pressure cell takes up residence over the Atlantic either to the northwest or northeast of Bermuda. The farther west/east the high develops will determine how far west/east Florence will eventually move and possibly affect the U.S. east coast beyond the 5-day forecast period. The new official forecast track is close to the previous

advisory track through 48 h, and then was nudged a little to the left or west of the previous track, which is close to the consensus model TVCN and is north of the corrected-consensus models FSSE and HCCA since the bulk of the NHC model guidance lies north of those latter two models.

The upper-level environment is expected to improve to significantly during the next 12 h and beyond with the current 20 kt of southwesterly shear forecast to give way to shear of less than 10 kt. By 72 h and beyond, light shear from the southeast and east along with the development of strong upper-level outflow jets to the north of Florence is expected to create an environment that favors significant and possibly even rapid strengthening. The new NHC intensity forecast has been increased over the previous advisory in anticipation of these very favorable dynamical conditions developing, and now shows Florence becoming a hurricane by Sunday and a major hurricane in 3 days, followed by additional strengthening over the very warm Atlantic waters of at least 29 deg C that are about 2 deg C above normal right now. The consensus models IVCN and HCCA were closely followed, which are a little below the FSSE model.

Key Messages:

1. Regardless of Florence's eventual track, large swells are affecting Bermuda and will begin to affect portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.
2. The risk of other direct impacts associated with Florence along the U.S. East Coast next week has increased. However, there is still very large uncertainty in model forecasts of Florence's track beyond day 5, making it too soon to determine the exact location, magnitude, and timing of these impacts. Interests near and along the U.S. East Coast should monitor the progress of Florence through the weekend and ensure they have their hurricane plans in place.

Tropical Storm FLORENCE

```

ZCZC MIAPWSAT1 ALL
TTAA00 KNHC DDHHMM
TROPICAL STORM FLORENCE WIND SPEED PROBABILITIES NUMBER 38
NWS NATIONAL HURRICANE CENTER MIAMI FL AL062018
2100 UTC SAT SEP 08 2018
AT 2100Z THE CENTER OF TROPICAL STORM FLORENCE WAS LOCATED NEAR
LATITUDE 24.6 NORTH...LONGITUDE 54.7 WEST WITH MAXIMUM SUSTAINED
WINDS NEAR 60 KTS...70 MPH...110 KM/H.
Z INDICATES COORDINATED UNIVERSAL TIME (GREENWICH)
ATLANTIC STANDARD TIME (AST)...SUBTRACT 4 HOURS FROM Z TIME
EASTERN DAYLIGHT TIME (EDT)...SUBTRACT 4 HOURS FROM Z TIME
CENTRAL DAYLIGHT TIME (CDT)...SUBTRACT 5 HOURS FROM Z TIME
WIND SPEED PROBABILITY TABLE FOR SPECIFIC LOCATIONS
CHANCES OF SUSTAINED (1-MINUTE AVERAGE) WIND SPEEDS OF AT LEAST
...34 KT (39 MPH... 63 KM/H)...
...50 KT (58 MPH... 93 KM/H)...
...64 KT (74 MPH...119 KM/H)...
FOR LOCATIONS AND TIME PERIODS DURING THE NEXT 5 DAYS
PROBABILITIES FOR LOCATIONS ARE GIVEN AS OP(CP) WHERE
OPIS THE PROBABILITY OF THE EVENT BEGINNING DURING
AN INDIVIDUAL TIME PERIOD (ONSET PROBABILITY)
(CP) IS THE PROBABILITY OF THE EVENT OCCURRING BETWEEN
18Z SAT AND THE FORECAST HOUR (CUMULATIVE PROBABILITY)
PROBABILITIES ARE GIVEN IN PERCENT
X INDICATES PROBABILITIES LESS THAN 1 PERCENT
PROBABILITIES FOR 34 KT AND 50 KT ARE SHOWN AT A GIVEN LOCATION WHEN
THE 5-DAY CUMULATIVE PROBABILITY IS AT LEAST 3 PERCENT.
PROBABILITIES FOR 34...50...64 KT SHOWN WHEN THE 5-DAY
64-KT CUMULATIVE PROBABILITY IS AT LEAST 1 PERCENT.

Tropical Storm Florence Discussion Number 37

NWS National Hurricane Center Miami FL 1100 AM AST Sat Sep 08 2018
AL062018

Florence has undergone a dramatic structural evolution just within the past 6 hours or so. Vertical shear has decreased just enough for the storm to take on a more symmetric shape, with convection developing in a ring around the low-level center, and an elongated band wrapping around to the northeastern part of the circulation. The convection has waned a little bit in intensity, however, due to the presence of dry air, and Dvorak estimates support maintaining an initial intensity of 55 kt for now. A NOAA P-3 aircraft is approaching Florence now on a research mission and should provide some useful data to better assess the storm's intensity.

Recent WindSat microwave data revealed that Florence has a well-defined low-level ring in the 37-GHz channel, which tends to be a harbinger of strengthening when environmental conditions are favorable. Since vertical shear is decreasing and should be 10 kt or less by later today, and Florence is heading toward a deeper pool of warm water over the southwestern Atlantic, a significant phase of intensification is likely to begin by tonight, continuing through Tuesday or Wednesday. In fact, the official intensity forecast explicitly shows rapid intensification occurring between 24 and 48 hours from now, and Florence is expected to become a major hurricane by Monday. The HFIP Corrected Consensus (HCCA) and the Florida State Superensemble (FSSE), both of which tend to do well in these scenarios, are both near the upper end of the guidance suite, especially through day 3. Even by days 4 and 5, the HWRf, HMON, and ICON intensity consensus are near the top end of the guidance, close to HCCA and FSSE. Given the signals in the environment, and the solutions provided by these models, the NHC

intensity forecast shows Florence reaching category 4 intensity by day 3 and maintains that through the end of the forecast period. Florence's longer-term motion is 265/6 kt. The cyclone appears to be slowing down as was expected, and this type of motion is likely to continue for the next 24-36 hours. In fact, the track guidance has slowed down during this period, and the updated NHC track forecast is a little slower than the previous one. After 36 hours, the most notable change in the models was a northeastward shift in the 06Z GFS. However, that run appears to be an outlier from the rest of the dynamical models, and its trend opposes the slight westward shift noted in the HCCA and FSSE aids. The updated NHC track forecast is therefore very close to or slightly west of the previous forecast on days 4 and 5. The exact path of Florence as it approaches the southeastern U.S. coastline will depend heavily on the position and strength of the blocking high pressure that is expected to develop north of Bermuda and extend westward over the eastern U.S., and so far there has not been much more clarity on those important details.

Key Messages:

1. Florence is forecast to be a dangerous major hurricane near the southeast U.S. coast by late next week, and the risk of direct impacts continues to increase. However, given the uncertainty in track and intensity forecasts at those time ranges, it's too soon to determine the exact timing, location, and magnitude of those impacts.
2. Interests along the U.S. East Coast, particularly from north Florida through North Carolina, should closely monitor the progress of Florence, ensure they have their hurricane plan in place, and follow any advice given by local officials.
3. Large swells are affecting Bermuda and will begin to affect portions of the U.S. East Coast this weekend, resulting in life-threatening surf and rip currents.

Tropical Storm FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHMM

Tropical Storm Florence Discussion Number 38

NWS National Hurricane Center Miami FL 500 PM AST Sat Sep 08 2018

AL062018

A NOAA P3 aircraft conducted a research mission several hours ago in Florence and measured SFMR surface winds of around 60 kt and winds up to 65 kt at a flight level of 8000 feet. Velocities of 65-70 kt at 500 meters were also measured by the Doppler radar on the plane. Based on these data, the initial wind speed is raised to 60 kt. Dropsonde data also showed that the central pressure was down to 989 mb.

Florence is slowly recovering from the dry air its circulation ingested while it was under the influence of strong shear.

Convection in the outer bands is relatively thin but is deeper and more persistent near the center. Now that the shear has decreased and the warm waters ahead of Florence reach deeper into the ocean, continued strengthening is anticipated. In fact, the official forecast continues to show a period of rapid intensification, now beginning 12-24 hours, with Florence reaching major hurricane intensity between 36-48 hours. One fly in the ointment is that the SHIPS diagnostics are keeping mid-level relative humidities around the cyclone around 50 percent, which isn't particularly moist, but I'm going to assume that Florence will be able to scour out the dry air within its circulation in the coming days. The HCCA model and the ICON intensity consensus support maintaining a forecast peak intensity of 125 kt in 4 days or so, so no significant changes were made from the previous forecast. Regardless of the specifics of the other models--some of which are higher and some of which are lower--Florence is expected to be a powerful major hurricane on days 3 through 5 as it moves across the southwestern Atlantic Ocean. Florence is creeping westward (270 degrees) at 4 kt, trapped between high pressure to its northeast and southwest. A different blocking ridge is expected to develop north and northeast of Bermuda over the next few days, causing Florence to accelerate toward the west-northwest and northwest between days 3-5. There have been some notable shifts in the model guidance on this cycle, with the ECMWF model swinging to the northeast closer to the GFS,

and the HWRF model swinging farther south along the southern edge of the guidance envelope. Despite this change in the deterministic ECMWF run, its individual ensemble members are still showing a significant spread of solutions from just north of the Bahamas to offshore the coast of North Carolina by day 5. Because of this spread, the updated NHC track forecast largely maintains continuity and remains close to the TVCN multi-model consensus. And despite the ECMWF's shift, this track prediction remains north of the HCCA and FSSE solutions.

Key Messages:

1. Florence is forecast to be a dangerous major hurricane near the southeast U.S. coast by late next week, and the risk of direct impacts continues to increase. However, given the uncertainty in track and intensity forecasts at those time ranges, it's too soon to determine the exact timing, location, and magnitude of those impacts.
2. Interests along the U.S. East Coast, particularly from north Florida through North Carolina, should closely monitor the progress of Florence, ensure they have their hurricane plan in place, and follow any advice given by local officials.
3. Large swells affecting Bermuda and portions of the U.S. East Coast will continue into next week. These swells will result in life-threatening surf and rip currents.

BULLETIN

Tropical Storm Florence Advisory Number 36

NWS National Hurricane Center Miami FL 500 AM AST Sat Sep 08 2018
AL062018

...FLORENCE FORECAST TO BECOME A HURRICANE BY SUNDAY...

...EXPECTED TO BECOME A MAJOR HURRICANE AGAIN EARLY NEXT WEEK...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...24.5N 54.2W
ABOUT 840 MI...1350 KM SE OF BERMUDA
ABOUT 720 MI...1155 KM NE OF THE NORTHERN LEEWARD ISLANDS
MAXIMUM SUSTAINED WINDS...65 MPH...100 KM/H
PRESENT MOVEMENT...W OR 265 DEGREES AT 9 MPH...14 KM/H
MINIMUM CENTRAL PRESSURE...997 MB...29.44 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Tropical Storm Florence was located near latitude 24.5 North, longitude 54.2 West. Florence is moving toward the west near 9 mph (14 km/h), and this general motion is expected to continue for the next couple days. A west-northwestward motion with an increase in forward speed is expected by early next week and continue into middle part of next week. On the forecast track, the center of Florence will move over the warm waters of the southwestern Atlantic Ocean through Wednesday. Maximum sustained winds are near 65 mph (100 km/h) with higher gusts. Gradual restrengthening is forecast over the weekend, and Florence is expected to become a hurricane again by Sunday and a major hurricane early next week.

Tropical-storm-force winds extend outward up to 140 miles (220 km) from the center.

The estimated minimum central pressure is 997 mb (29.44 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and will reach portions of the U.S. East Coast over the weekend. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.
NEXT ADVISORY

Next complete advisory at 1100 AM AST.

Tropical Storm Florence Discussion Number 39

NWS National Hurricane Center Miami FL 1100 PM AST Sat Sep 08 2018

AL062018

Satellite images indicate that the cloud pattern has continued to gradually become better organized with an eye feature trying to form. An average of all of the Dvorak satellite intensity estimates tonight suggest that Florence is not a hurricane yet, but is close to being one. The initial intensity is kept at 60 kt in this advisory. The recent ASCAT data showed less winds than previously observed by the NOAA plane when the cloud pattern was less organized.

There is a band of convection trying to wrap around a possible eye feature, and that is an indication that Florence has continued to recover from the hostile shear environment, which brought the hurricane from Category 4 to a tropical storm in a matter of a day or so. The presence of developing upper-level outflow is a good indication that the shear has decreased, and with the presence of a warm ocean ahead, strengthening is anticipated. As indicated by my predecessor, the official forecast continues to call for a period of rapid intensification in about 12-24 hours, and Florence is expected to reach major hurricane intensity between 36-48 hours with additional strengthening thereafter. Florence is forecast to be an intense hurricane on days 3 through 5 as it moves across the warm waters of the southwestern Atlantic Ocean between the Bahamas and Bermuda, and then as it heads toward the southeast United States coast.

Florence is still trapped within very light steering currents, and is slowly moving toward the west or 270 degrees at 5 kt. All indications are that this is about to change, as a strong ridge of high pressure builds to the north of the hurricane. This forecast flow pattern predicted by the global models will force Florence on a general west-northwest to northwest track with an increase in forward speed. The NHC forecast is basically on top of the previous one, and is in the middle of the narrow guidance envelope mainly for the next 3 to 4 days. By the end of the forecast period, when the hurricane is approaching the U.S. coast, the guidance envelope is wider and becomes bounded by the northernmost GFS and the southernmost HCCA and the FSSE ensembles. One thing all models coincide at the longer range is with the collapsing of the steering currents, resulting in a significant reduction of the forward speed of the hurricane.

Key Messages:

1. Florence is forecast to be a dangerous major hurricane near the southeast U.S. coast by late next week, and the risk of direct impacts continues to increase. However, given the uncertainty in track and intensity forecasts at those time ranges, it's too soon to determine the exact timing, location, and magnitude of those impacts.
2. Interests along the U.S. East Coast, particularly from north Florida through North Carolina, should closely monitor the progress of Florence, ensure they have their hurricane plan in place, and follow any advice given by local officials.
3. Large swells affecting Bermuda and portions of the U.S. East Coast will continue into next week. These swells will result in life-threatening surf and rip currents.

FORECAST POSITIONS AND MAX WINDS

BULLETIN

Tropical Storm Florence Advisory Number 40

NWS National Hurricane Center Miami FL 500 AM AST Sun Sep 09 2018

AL062018

...FLORENCE EXPECTED TO BECOME A HURRICANE TODAY...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...24.5N 55.8W

ABOUT 765 MI...1235 KM SE OF BERMUDA

ABOUT 640 MI...1030 KM NE OF THE NORTHERN LEEWARD ISLANDS

MAXIMUM SUSTAINED WINDS...70 MPH...110 KM/H

PRESENT MOVEMENT...W OR 270 DEGREES AT 6 MPH...9 KM/H

MINIMUM CENTRAL PRESSURE...989 MB...29.21 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Tropical Storm Florence was located near latitude 24.5 North, longitude 55.8 West. Florence is moving toward the west near 6 mph (9 km/h), and this general motion is expected to continue today. A west-northwestward motion with an increase in forward speed is expected by Monday, and that motion is forecast to continue through mid-week. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the southeastern U.S. coast on Thursday.

Maximum sustained winds are near 70 mph (110 km/h) with higher gusts. Florence is expected to become a hurricane today and rapid intensification is likely to begin by tonight. Florence is forecast

to become a major hurricane on Monday.
Tropical-storm-force winds extend outward up to 125 miles (205 km)
from the center.
The estimated minimum central pressure is 989 mb (29.21 inches).
HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and are
beginning to reach portions of the U.S. East Coast. These swells
are likely to cause life-threatening surf and rip current
conditions. Please consult products from your local weather office.
NEXT ADVISORY

Next complete advisory at 1100 AM AST.

Hurricane Florence Discussion Number 41

NWS National Hurricane Center Miami FL 1100 AM AST Sun Sep 09 2018

AL062018

Satellite images indicate that Florence is strengthening. Deep convection has intensified in the central dense overcast, with hints of a ragged eye in the latest GOES-16 visible channel. The NOAA Hurricane Hunters just flew through the eye, finding 70 kt winds at flight-level and 66 kt from the SFMR. This data confirms that Florence has become a hurricane again, and the initial wind speed is set to 65 kt. The aircraft also found that the minimum pressure has decreased to 984 mb.

Overnight microwave data and the Hurricane Hunter vortex message show that a mostly complete eyewall has formed with Florence. In combination with low vertical wind shear and progressively warmer waters near 29C, this structure is a blueprint for rapid intensification. Almost all of the intensity guidance is showing at least one period of rapid strengthening during the next few days, which is rather rare. The NHC wind speed forecast is raised in the first couple of days following the guidance trend, then is very similar to the previous one. All indications are that Florence will be an extremely dangerous Category 4 hurricane while it moves over the western Atlantic toward the southeastern United States.

Florence continues moving slowly westward, caught between a pair of mid-level ridges over the Atlantic Ocean. A very strong ridge is forecast to build over the northwestern Atlantic during the next few days, which should steer Florence west-northwestward at a much faster forward speed. By Wednesday, the hurricane should turn northwestward, and slow down somewhat due to another ridge forming over the Ohio Valley. It is interesting to note that while the ensemble means from the ECMWF and UKMET are west of the NHC forecast, the strongest members are on the right side of their ensemble envelope. Thus, the new NHC track forecast is very similar to the previous one, and continues to lie between the corrected consensus and consensus aids. The Ohio Valley ridge is concerning because Florence could stop moving pretty quickly around day 5, potentially leading to a serious heavy rain episode and inland flood hazard.

Key Messages:

1. There is an increasing risk of two life-threatening impacts from Florence: storm surge at the coast and freshwater flooding from a prolonged heavy rainfall event inland. While it is too soon to determine the exact timing, location, and magnitude of these impacts, interests at the coast and inland from South Carolina into the mid-Atlantic region should closely monitor the progress of Florence, ensure they have their hurricane plan in place, and follow any advice given by local officials.

Hurricane Florence Discussion Number 42

NWS National Hurricane Center Miami FL 500 PM AST Sun Sep 09 2018

AL062018

The last reconnaissance fix indicated that the pressure had fallen to about 978 mb with Florence, a drop of about 6 mb in 4 hours, with uncontaminated SFMR winds of about 70 kt. Since then, the satellite presentation has continued to improve, with intensifying deep convection near the center. Thus the wind speed is set to 75 kt on this advisory.

Radar data from the NOAA Hurricane Hunter indicated that there were still a few breaks in the eyewall, possibly allowing some dry air to mix into the core. This structure has potentially kept Florence from intensifying rapidly so far. It is likely, however, that the eyewall will close soon with low environmental shear present, resulting in a faster intensification rate. The guidance is remarkably well clustered, with all of the hurricane models showing category 4 strength within 48 hours, which is uncommon given the current intensity. The new forecast continues to show rapid intensification and is increased 5 or 10 kt at most time periods, but it is still not as high as the Florida State Superensemble or the NOAA corrected consensus models. It is worth noting that the model guidance is also significantly increasing the size of Florence's wind field over the next few days, and the official forecast reflects this trend.

The fixes from the aircraft indicate that Florence hasn't gained much latitude yet, and continues moving westward at about 6 kt. There is no change to the synoptic reason as a very strong ridge is forecast to build over the northwestern Atlantic during the next few days. This pattern should steer Florence west-northwestward at a much faster forward speed by Tuesday. On Wednesday, the hurricane will likely turn northwestward and slow down somewhat due to another ridge forming over the Ohio Valley. The most notable change from the previous advisory is that most of the models are showing a faster motion in 3 or 4 days, which unfortunately increases the risk of a destructive hurricane landfall. The GFS and its ensemble mean are outliers from the main model envelope, showing the system near the Outer Banks, while the rest of the guidance is well to the southwest. While a near-miss isn't impossible given the spread of the ECMWF Ensemble, there is much more support for a track to the

southwest, especially considering the poleward bias of the GFS thus far this season. Therefore, the official track forecast is shifted a little bit to the southwest, and is very close to the corrected-consensus models.

The NOAA G-IV jet is conducting a synoptic surveillance mission this afternoon to gather data near and around Florence for assimilation into the numerical models, and these missions will continue through Tuesday. In addition, upper-air stations across portions of the central and eastern U.S. are conducting special 0600 UTC and 1800 UTC radiosonde launches to collect extra data for the numerical models. Hopefully these data will help improve the track and intensity forecasts.

Key Messages:

1. There is an increasing risk of two life-threatening impacts from Florence: storm surge at the coast and freshwater flooding from a prolonged heavy rainfall event inland. While it is too soon to determine the exact timing, location, and magnitude of these impacts, interests at the coast and inland from South Carolina into the mid-Atlantic region should closely monitor the progress of Florence, ensure they have their hurricane plan in place, and follow any advice given by local officials.

2. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week. These swells will result in life-threatening surf and rip currents.

Hurricane Florence Discussion Number 43

NWS National Hurricane Center Miami FL 1100 PM AST Sun Sep 09 2018

AL062018

Florence's satellite appearance has continued to improve quite markedly since the previous advisory. An eye was evident in GOES-16 high-resolution infrared imagery and other channels between

2300-0000 UTC, but it became cloud covered immediately thereafter due to a strong burst of deep convection in the southern and eastern eyewall where cloud tops colder than -80C and an abundance of lightning activity was observed. Since that time, the CDO has expanded and become more circular, outflow has increased and become more symmetrical, and an eye has begun to re-appear. The initial intensity has been increased to 80 kt for this advisory based on a subjective Dvorak intensity estimate of T4.5/77 kt from SAB and NHC objective intensity estimates ranging from 77 kt to 87 kt. The initial motion estimate is 280/06 kt. Once again, there is no significant change to the previous forecast track or synoptic reasoning. The models appear to be getting better dialed in on both the location and strength of the developing blocking ridge in the vicinity of Bermuda during the next 4 days as the mid-latitude flow amplifies across the CONUS and the northwestern Atlantic. In fact, the global models are now in very good agreement on forecasting Florence's upper-level mass outflow being deposited to the north and east of the hurricane, which will act to further strengthen the blocking ridge and help to drive the hurricane northwestward toward the southeastern U.S. coastal region. The new NHC model guidance is even more tightly packed about the previous forecast track, with less than a 90 n mi cross-track spread at 72 h and less than 120 n mi spread at 96 h, just prior to expected landfall. Therefore, the new official advisory track is essentially just an update and extension of the previous forecast, and lies between the nearly juxtaposed HCCA and FSSE corrected consensus track models. Now that Florence has developed an inner-core ring of deep convection, which has insulated the eye from intrusions of dry air, rapid intensification appears likely to begin soon and continue for the next 36 hours or so due to the expected very low vertical wind shear conditions, dual outflow jet pattern that will be developing, and very warm SSTs of 29-29.5 deg C beneath the hurricane. The most favorable combination of the aforementioned factors will occur in about 48 h, and that's when Florence is likely to achieve its maximum intensity. After 72 hours, the wind shear is expected to increase to around 10-15 kt from the south or southwest, and the dual outflow pattern is forecast to change to only a single poleward outflow pattern. This slight degradation in the upper-level environment, along with slightly cooler SSTs, is expected to result in a gradual weakening of the powerful cyclone. However, Florence is still forecast to be near category-4 strength when the dangerous hurricane makes landfall. The official intensity forecast is an average of the intensity forecast from the corrected consensus models HCCA and FSSE, with the latter explicitly forecasting a peak intensity of 134 kt in 72 hours. It is also worth noting that the model guidance is also significantly increasing the size of Florence's wind field over the next few days, and the official forecast reflects this trend.

The NOAA G-IV jet will conduct another synoptic surveillance mission early Monday morning in support of the 1200 UTC model cycle, and these flights will continue through Tuesday. In addition, upper-air stations across portions of the central and eastern U.S. are conducting special 0600 UTC and 1800 UTC radiosonde launches to collect extra data for the numerical models. Hopefully these data

will help improve the track and intensity forecasts.

Key Messages:

1. There is an increasing risk of two life-threatening impacts from Florence: storm surge at the coast and freshwater flooding from a prolonged heavy rainfall event inland. While it is too soon to determine the exact timing, location, and magnitude of these impacts, interests at the coast and inland from South Carolina into the mid-Atlantic region should closely monitor the progress of Florence, ensure they have their hurricane plan in place, and follow any advice given by local officials.

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 40

NWS National Hurricane Center Miami FL 500 AM AST Sun Sep 09 2018

AL062018

Florence's cloud pattern has continued to gradually become better organized overnight, with an increase in convection near the center and a developing central dense overcast feature. However, the

cloud tops are not particularly cold and the outer banding features remain fragmented likely due to some nearby dry mid-level air. Dvorak intensity estimates from TAFB and SAB range from 55 to 65 kt, so the initial intensity remains 60 kt, just shy of hurricane strength. The NOAA Hurricane Hunters are scheduled to investigate the storm later today, and that data should provide a better assessment of Florence's intensity.

The upper-level outflow is becoming well established over the cyclone, and the global model guidance indicates that Florence will remain in a very favorable upper-level environment while the cyclone moves over the warm waters over the southwestern Atlantic. These conditions favor strengthening with the only apparent negative factor being nearby dry air, which will likely remain away from the inner core due to the low shear conditions. The NHC intensity forecast again calls for a period of rapid strengthening within the next 12-36 hours, and Florence is forecast to become a major hurricane on Monday with additional strengthening early in the week. This means that Florence is likely to be a very powerful hurricane as it moves over the western Atlantic toward the southeastern United States. The new NHC intensity forecast is near the various intensity consensus aids and is very similar to the previous official forecast.

Florence is currently located between a couple of mid-level ridges and a slow westward motion is expected today. Another strong high pressure ridge is forecast to build to the north of Florence on Monday, which should cause the storm to begin moving west-northwestward to northwestward at an increasingly faster forward speed. The dynamical model guidance is tightly clustered for the first 2-3 days with increasing spread thereafter. The GFS remains along the right side of the guidance envelope with the HWRF and ECMWF bracketing the left edge. It should be noted that both the GFS and ECMWF ensemble means are a little to the left or west of their operational runs. As a result, the NHC track forecast lies to the left of the TVCA multi-model consensus, but is not as far to the west as the FSSE and HCCA corrected consensus models at day 5. The models are in agreement that Florence is likely to slow down near the end of the forecast period as a blocking high pressure ridge builds to the north of the hurricane.

Key Messages:

1. Florence is forecast to be a dangerous major hurricane near the southeast U.S. coast by late this week, and the risk of direct impacts continues to increase. However, given the uncertainty in track and intensity forecasts at those time ranges, it's too soon to determine the exact timing, location, and magnitude of those impacts.
2. Interests along the U.S. East Coast, particularly from north Florida through North Carolina, should closely monitor the progress of Florence, ensure they have their hurricane plan in place, and follow any advice given by local officials.
3. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week. These swells will result in life-threatening surf and rip currents.

TTAA00 KNHC DDHMM

BULLETIN

Hurricane Florence Advisory Number 43

NWS National Hurricane Center Miami FL 1100 PM AST Sun Sep 09 2018

AL062018

...FLORENCE CONTINUES TO STRENGTHEN...

...EXPECTED TO BECOME A MAJOR HURRICANE BY MONDAY NIGHT...

SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...24.6N 57.7W

ABOUT 685 MI...1100 KM SE OF BERMUDA

ABOUT 560 MI...905 KM NE OF THE NORTHERN LEEWARD ISLANDS

MAXIMUM SUSTAINED WINDS...90 MPH...150 KM/H

PRESENT MOVEMENT...W OR 280 DEGREES AT 7 MPH...11 KM/H

MINIMUM CENTRAL PRESSURE...974 MB...28.77 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

Interests in the southeastern and mid-Atlantic states should monitor the progress of Florence.

DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Hurricane Florence was located near latitude 24.6 North, longitude 57.7 West. Florence is moving toward the west near 7 mph (11 km/h), and this general motion is forecast to continue tonight. A west-northwestward motion with an increase in forward speed is expected on Monday, and that motion is forecast to continue through mid-week. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the southeastern coast of the United States on Thursday. Satellite data indicate that maximum sustained winds have increased to near 90 mph (150 km/h) with higher gusts. Florence is forecast to rapidly strengthen to a major hurricane by Monday night, and is expected to remain an extremely dangerous major hurricane through Thursday.

Hurricane-force winds extend outward up to 25 miles (35 km) from the center and tropical-storm-force winds extend outward up to 125 miles (205 km).

The estimated minimum central pressure is 974 mb (28.77 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 500 AM AST.

BULLETIN

Hurricane Florence Advisory Number 42
NWS National Hurricane Center Miami FL 500 PM AST Sun Sep 09 2018
AL062018

...NOAA HURRICANE HUNTER FINDS FLORENCE STRENGTHENING...
...FORECAST TO BECOME A MAJOR HURRICANE ON MONDAY...
SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...24.4N 57.0W
ABOUT 720 MI...1160 KM SE OF BERMUDA
ABOUT 580 MI...935 KM NE OF THE NORTHERN LEEWARD ISLANDS

MAXIMUM SUSTAINED WINDS...85 MPH...140 KM/H
PRESENT MOVEMENT...W OR 270 DEGREES AT 7 MPH...11 KM/H
MINIMUM CENTRAL PRESSURE...975 MB...28.80 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.
Interests in the southeastern and mid-Atlantic states should monitor the progress of Florence.
DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the center of Hurricane Florence was located near latitude 24.4 North, longitude 57.0 West. Florence is moving toward the west near 7 mph (11 km/h), and this general motion is expected to continue today. A west-northwestward motion with an increase in forward speed is expected by Monday, and that motion is forecast to continue through mid-week. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the southeastern coast of the United States on Thursday. Aircraft and satellite data indicate that maximum sustained winds have increased to near 85 mph (140 km/h) with higher gusts. Florence is forecast to rapidly strengthen to a major hurricane by Monday, and is expected to remain an extremely dangerous major hurricane through Thursday. Hurricane-force winds extend outward up to 25 miles (35 km) from the center and tropical-storm-force winds extend outward up to 125 miles (205 km). Florence is forecast to become larger over the next few days. The estimated minimum central pressure from NOAA Hurricane Hunter and satellite data is 975 mb (28.80 inches).
HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

Hurricane FLORENCE

ZCZC MIAPWSAT1 ALL

TTAA00 KNHC DDHHMM

HURRICANE FLORENCE WIND SPEED PROBABILITIES NUMBER 41

NWS NATIONAL HURRICANE CENTER MIAMI FL AL062018

1500 UTC SUN SEP 09 2018

AT 1500Z THE CENTER OF HURRICANE FLORENCE WAS LOCATED NEAR LATITUDE
24.4 NORTH...LONGITUDE 56.3 WEST WITH MAXIMUM SUSTAINED WINDS NEAR
65 KTS...75 MPH...120 KM/H.

Z INDICATES COORDINATED UNIVERSAL TIME (GREENWICH)

ATLANTIC STANDARD TIME (AST)...SUBTRACT 4 HOURS FROM Z TIME

EASTERN DAYLIGHT TIME (EDT)...SUBTRACT 4 HOURS FROM Z TIME

CENTRAL DAYLIGHT TIME (CDT)...SUBTRACT 5 HOURS FROM Z TIME

WIND SPEED PROBABILITY TABLE FOR SPECIFIC LOCATIONS

CHANCES OF SUSTAINED (1-MINUTE AVERAGE) WIND SPEEDS OF AT LEAST

...34 KT (39 MPH... 63 KM/H)...

...50 KT (58 MPH... 93 KM/H)...

...64 KT (74 MPH...119 KM/H)...

FOR LOCATIONS AND TIME PERIODS DURING THE NEXT 5 DAYS

PROBABILITIES FOR LOCATIONS ARE GIVEN AS OP(CP) WHERE

OP IS THE PROBABILITY OF THE EVENT BEGINNING DURING

AN INDIVIDUAL TIME PERIOD (ONSET PROBABILITY)

(CP) IS THE PROBABILITY OF THE EVENT OCCURRING BETWEEN

12Z SUN AND THE FORECAST HOUR (CUMULATIVE PROBABILITY)

PROBABILITIES ARE GIVEN IN PERCENT

X INDICATES PROBABILITIES LESS THAN 1 PERCENT

PROBABILITIES FOR 34 KT AND 50 KT ARE SHOWN AT A GIVEN LOCATION WHEN

THE 5-DAY CUMULATIVE PROBABILITY IS AT LEAST 3 PERCENT.

PROBABILITIES FOR 34...50...64 KT SHOWN WHEN THE 5-DAY

64-KT CUMULATIVE PROBABILITY IS AT LEAST 1 PERCENT.

Hurricane FLORENCE

ZCZC MIAPWSAT1 ALL

TTAA00 KNHC DDHHMM

HURRICANE FLORENCE WIND SPEED PROBABILITIES NUMBER 42

NWS NATIONAL HURRICANE CENTER MIAMI FL AL062018

2100 UTC SUN SEP 09 2018

AT 2100Z THE CENTER OF HURRICANE FLORENCE WAS LOCATED NEAR LATITUDE
24.4 NORTH...LONGITUDE 57.0 WEST WITH MAXIMUM SUSTAINED WINDS NEAR
75 KTS...85 MPH...140 KM/H.

Z INDICATES COORDINATED UNIVERSAL TIME (GREENWICH)

ATLANTIC STANDARD TIME (AST)...SUBTRACT 4 HOURS FROM Z TIME

EASTERN DAYLIGHT TIME (EDT)...SUBTRACT 4 HOURS FROM Z TIME

CENTRAL DAYLIGHT TIME (CDT)...SUBTRACT 5 HOURS FROM Z TIME

WIND SPEED PROBABILITY TABLE FOR SPECIFIC LOCATIONS

CHANCES OF SUSTAINED (1-MINUTE AVERAGE) WIND SPEEDS OF AT LEAST

...34 KT (39 MPH... 63 KM/H)...

...50 KT (58 MPH... 93 KM/H)...

...64 KT (74 MPH...119 KM/H)...

FOR LOCATIONS AND TIME PERIODS DURING THE NEXT 5 DAYS

PROBABILITIES FOR LOCATIONS ARE GIVEN AS OP(CP) WHERE

OP IS THE PROBABILITY OF THE EVENT BEGINNING DURING

AN INDIVIDUAL TIME PERIOD (ONSET PROBABILITY)

(CP) IS THE PROBABILITY OF THE EVENT OCCURRING BETWEEN

18Z SUN AND THE FORECAST HOUR (CUMULATIVE PROBABILITY)

PROBABILITIES ARE GIVEN IN PERCENT

X INDICATES PROBABILITIES LESS THAN 1 PERCENT
 PROBABILITIES FOR 34 KT AND 50 KT ARE SHOWN AT A GIVEN LOCATION WHEN
 THE 5-DAY CUMULATIVE PROBABILITY IS AT LEAST 3 PERCENT.
 PROBABILITIES FOR 34...50...64 KT SHOWN WHEN THE 5-DAY
 64-KT CUMULATIVE PROBABILITY IS AT LEAST 1 PERCENT.

- - - - WIND SPEED PROBABILITIES FOR SELECTED LOCATIONS - - - -

Hurricane FLORENCE

ZCZC MIATCPAT1 ALL
TTAA00 KNHC DDHMM
BULLETIN

Hurricane Florence Advisory Number 41
NWS National Hurricane Center Miami FL 1100 AM AST Sun Sep 09 2018
AL062018

...FLORENCE FORECAST TO RAPIDLY INTENSIFY INTO A MAJOR HURRICANE BY
MONDAY...

SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...24.4N 56.3W
ABOUT 750 MI...1210 KM SE OF BERMUDA

ABOUT 610 MI...985 KM NE OF THE NORTHERN LEEWARD ISLANDS
MAXIMUM SUSTAINED WINDS...75 MPH...120 KM/H
PRESENT MOVEMENT...W OR 270 DEGREES AT 6 MPH...9 KM/H
MINIMUM CENTRAL PRESSURE...984 MB...29.06 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the center of Hurricane Florence was located by a NOAA Hurricane Hunter aircraft near latitude 24.4 North, longitude 56.3 West. Florence is moving toward the west near 6 mph (9 km/h), and this general motion is expected to continue today. A west-northwestward motion with an increase in forward speed is expected by Monday, and that motion is forecast to continue through mid-week. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the southeastern U.S. coast on Thursday.

Aircraft data indicate that maximum sustained winds have increased to near 75 mph (120 km/h) with higher gusts. Florence is forecast to rapidly strengthen to a major hurricane by Monday, and is expected to remain an extremely dangerous major hurricane through Thursday.

Hurricane-force winds extend outward up to 15 miles (30 km) from the center and tropical-storm-force winds extend outward up to 115 miles (185 km).

The latest minimum central pressure reported by a NOAA Hurricane Hunter Aircraft is 984 mb (29.06 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and are beginning to reach portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.
NEXT ADVISORY

Next complete advisory at 500 PM AST.

BULLETIN

Hurricane Florence Advisory Number 44

NWS National Hurricane Center Miami FL 500 AM AST Mon Sep 10 2018

AL062018

...FLORENCE RAPIDLY STRENGTHENING...

...EXPECTED TO BECOME A MAJOR HURRICANE VERY SOON...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...24.9N 58.9W

ABOUT 625 MI...1005 KM SE OF BERMUDA

ABOUT 535 MI...860 KM NNE OF THE NORTHERN LEEWARD ISLANDS

MAXIMUM SUSTAINED WINDS...105 MPH...165 KM/H

PRESENT MOVEMENT...WNW OR 285 DEGREES AT 9 MPH...15 KM/H

MINIMUM CENTRAL PRESSURE...969 MB...28.62 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

Interests in the southeastern and mid-Atlantic states should monitor the progress of Florence.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Hurricane Florence was located near latitude 24.9 North, longitude 58.9 West. Florence is moving toward the west-northwest near 9 mph (15 km/h). A west-northwestward motion with an increase in forward speed is expected during the next couple of days. A turn toward the northwest is forecast to occur Wednesday night or Thursday. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the southeastern coast of the United States on Thursday.

Satellite imagery indicates that the maximum sustained winds have increased to near 105 mph (165 km/h) with higher gusts. Rapid strengthening is forecast, and Florence is forecast to become a major hurricane this morning, and is expected to remain an extremely dangerous major hurricane through Thursday.

Hurricane-force winds extend outward up to 25 miles (35 km) from the center and tropical-storm-force winds extend outward up to 125 miles (205 km).

The estimated minimum central pressure is 969 mb (28.62 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause

life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 1100 AM AST.

Hurricane Florence Discussion Number 45

NWS National Hurricane Center Miami FL 1100 AM AST Mon Sep 10 2018
AL062018

Florence is quickly becoming a powerful hurricane. Satellite images show that the distinct eye has warmed in the center, with convection increasing in the eyewall during the past several hours. The initial wind speed is set to 100 kt, closest to the CIMSS-ADT value. A NOAA Hurricane Hunter will be in the area later this morning for a more accurate estimate.

The hurricane is moving over progressively warmer waters over the next couple of days, with water temperatures peaking near 85F. In combination with the low vertical wind shear in the forecast during that time, Florence should continue to strengthen, and all models show it becoming a category 4 hurricane by tomorrow. The corrected-consensus guidance has done quite well with this intensification episode, and I don't see any reason to deviate much from them at this time. As Florence approaches the southeastern United States, there will likely be fluctuations in intensity from eyewall cycles, but even if this occurs, the hurricane's wind field

is expected to grow with time, increasing the storm surge and inland wind threats. The bottom line is that there is increasing confidence that Florence will be a large and extremely dangerous hurricane, regardless of its exact intensity.

During the last several hours, Florence has turned westward again, estimated at 11 kt. The steering currents are becoming well-defined as a very strong ridge builds over the northwestern Atlantic Ocean, forcing Florence to move faster toward the west-northwest during the next couple of days. By late Wednesday, a turn toward the northwest is possible due to the orientation of the Atlantic ridge, along with a slight decrease in forward speed due to a new ridge building over the Great Lakes. The various models are shifting around at long range, but the model consensus has barely budged in the past few model cycles. Thus the new NHC forecast is close to the previous one, near the NOAA and FSSE consensus guidance. It is important not to focus on the exact forecast track as average NHC errors at days 4 and 5 are about 140 and 180 n mi, respectively, and dangerous hazards will extend well away from the center.

Key Messages:

1. A life-threatening storm surge is likely along portions of the coastlines of South Carolina, North Carolina, and Virginia, and a Storm Surge Watch will likely be issued for some of these areas by Tuesday morning. All interests from South Carolina into the mid-Atlantic region should ensure they have their hurricane plan in place and follow any advice given by local officials.
2. Life-threatening freshwater flooding is likely from a prolonged and exceptionally heavy rainfall event, which may extend inland over the Carolinas and Mid Atlantic for hundreds of miles as Florence is expected to slow down as it approaches the coast and moves inland.
3. Damaging hurricane-force winds are likely along portions of the coasts of South Carolina and North Carolina, and a Hurricane Watch will likely be issued by Tuesday morning. Damaging winds could also spread well inland into portions of the Carolinas and Virginia.
4. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week, resulting in life-threatening surf and rip currents.

Hurricane FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Hurricane Florence Discussion Number 46

NWS National Hurricane Center Miami FL 500 PM AST Mon Sep 10 2018

AL062018

Unfortunately, the models were right. Florence has rapidly intensified into an extremely dangerous hurricane, with 30-second GOES-16 visible imagery showing well-defined eyewall mesovortices rotating inside of the eye. A NOAA Hurricane Hunter aircraft found peak SFMR winds of about 120 kt, with flight-level winds and dropsonde measurements also supporting that value for the initial wind speed estimate. Notably, the aircraft data also show the size of the hurricane-force winds has doubled in the past 12 hours.

None of the guidance suggest that Florence has peaked in intensity, and this is supported by a continuation of a low-shear environment, and even warmer waters over the next 36 hours. Thus, the intensity forecast is raised from the previous one, bringing Florence close to category 5 strength tomorrow. Near landfall, the vertical wind shear could increase, along with the increasing likelihood of eyewall cycles. While the intensity forecast shows some weakening of the maximum winds near landfall, the wind field is expected to grow with time, which increases the storm surge and inland wind threats. The bottom line is that there is high confidence that Florence will be a large and extremely dangerous hurricane, regardless of its exact intensity.

Florence has recently turned west-northwestward, still moving at 11 kt. The hurricane is expected to accelerate in that direction over the next day or two due to building mid-level ridge over the northwestern Atlantic Ocean. By late Wednesday, a turn toward the northwest is forecast due to the orientation of the Atlantic ridge, along with a decrease in forward speed due to a new ridge building over the Great Lakes. There is a new player in the forecast as well, with the disturbance over the northwestern Caribbean adding some uncertainty in the ridge strength over the southeastern United States. Perhaps it isn't surprising that the model spread has increased on this cycle, with a small eastward shift overall. The official forecast is nudged in the direction of the trend, but is west of the model consensus. It is important not to focus on the exact forecast track as average NHC errors at days 4 and 5 are about 140 and 180 n mi, respectively, and dangerous hazards will extend well away from the center.

The NOAA G-IV jet will continue to conduct synoptic surveillance missions every 12 h through at least Wednesday. In addition, special 0600 UTC and 1800 UTC radiosonde launches have been expanded to additional upper-air stations across the U.S. are to collect extra data for the numerical models.

Key Messages:

1. A life-threatening storm surge is likely along portions of the

coastlines of South Carolina, North Carolina, and Virginia, and a Storm Surge Watch will likely be issued for some of these areas by Tuesday morning. All interests from South Carolina into the mid-Atlantic region should ensure they have their hurricane plan in place and follow any advice given by local officials.

2. Life-threatening freshwater flooding is likely from a prolonged and exceptionally heavy rainfall event, which may extend inland over the Carolinas and Mid Atlantic for hundreds of miles as Florence is expected to slow down as it approaches the coast and moves inland.

3. Damaging hurricane-force winds are likely along portions of the coasts of South Carolina and North Carolina, and a Hurricane Watch will likely be issued by Tuesday morning. Damaging winds could also spread well inland into portions of the Carolinas and Virginia.

4. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week, resulting in life-threatening surf and rip currents.

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM CCA

Hurricane Florence Discussion Number 44...CORRECTED

NWS National Hurricane Center Miami FL AL062018

500 AM AST Mon Sep 10 2018

Corrected to reflect that the 96 hour forecast point is inland. Florence is rapidly strengthening this morning. The satellite presentation has improved markedly overnight with a small 10-n-mi wide-eye becoming apparent in infrared satellite pictures. The upper-level outflow continues to expand over the northern and northwestern portions of the storm, but is somewhat restricted over the southeastern quadrant. Dvorak satellite classifications from TAFB and SAB supported an intensity of around 80 kt at 0600 UTC, but with the cooling of the cloud tops around the eye since that time, the initial intensity has been increased to 90 kt for this advisory. Satellite fixes indicate that Florence has turned west-northwestward (285 degrees), and is moving at a slightly faster forward speed of 8 kt. A high pressure ridge building to the north and northwest of Florence is expected to steer the hurricane west-northwestward to northwestward at a much faster forward speed over the southwest Atlantic during the next few days. After that time, a building ridge over the Ohio Valley is expected to cause a gradual reduction in the forward speed of the cyclone as it approaches the southeastern United States coastline. The latest run of the ECMWF has shifted southwestward, along with its ensemble suite, while there was little overall change in the GFS and its ensemble. On the other hand, the UKMET shifted northeastward and is now along the right side of the guidance envelope. With these changes to the guidance, the overall spread has increased this cycle, however, the corrected consensus aids (FSSE and HCCA) are not much different than before, and the NHC track again follows these models very closely. Users are cautioned to not focus on the exact forecast track as the average NHC errors at days 4 and 5 are about 140 and 180 n mi, respectively.

Florence will be traversing very warm SSTs of around 29C and remain within a very favorable upper-level environment during the next couple of days. These conditions are expected to lead to significant strengthening during the next 12 to 24 hours, and Florence is forecast to be a very powerful major hurricane on its approach to the southeastern United States. The NHC intensity forecast is slightly above all of the intensity guidance during the first 24 hours, and is then a blend of the FSSE and HCCA models. The global model guidance also increases the size of Florence's wind field during the next few days, and this has been reflected in the NHC wind radii forecast.

The NOAA G-IV jet is conducting another synoptic surveillance mission this morning in support of the 1200 UTC model cycle, and these flights will continue through Tuesday. A NOAA P-3 Hurricane Hunter aircraft is also scheduled to conduct a research mission into Florence this morning, with Air Force C-130 fix missions beginning late this afternoon. Additional upper-air data are being collected across portions of the central and eastern U.S. via special 0600 UTC and 1800 UTC radiosonde launches. Hopefully these data will help improve the track and intensity forecasts.

Key Messages:

1. There is an increasing risk of life-threatening impacts from Florence: storm surge at the coast, freshwater flooding from a prolonged and exceptionally heavy rainfall event inland, and damaging hurricane-force winds. While it is too soon to determine the exact timing, location, and magnitude of these impacts, interests at the coast and inland from South Carolina into the mid-Atlantic region should closely monitor the progress of Florence, ensure they have their hurricane plan in place, and follow any advice given by local officials.

2. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week. These swells will result in life-threatening surf and rip currents.

BULLETIN

Hurricane Florence Advisory Number 47

NWS National Hurricane Center Miami FL 1100 PM AST Mon Sep 10 2018

AL062018

...FLORENCE CHANGES LITTLE IN STRENGTH DURING THE PAST SEVERAL
HOURS...

TUESDAY...

...HURRICANE AND STORM SURGE WATCHES LIKELY TO BE ISSUED ON
SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...25.9N 62.4W

ABOUT 465 MI...750 KM SSE OF BERMUDA

ABOUT 1085 MI...1745 KM ESE OF CAPE FEAR NORTH CAROLINA

MAXIMUM SUSTAINED WINDS...140 MPH...220 KM/H

PRESENT MOVEMENT...WNW OR 290 DEGREES AT 13 MPH...20 KM/H

MINIMUM CENTRAL PRESSURE...944 MB...27.88 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect. Interests in the southeastern and mid-Atlantic states should monitor the progress of Florence. Storm Surge and Hurricane watches are likely to be issued for portions of these areas on Tuesday.

DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Hurricane Florence was located near latitude 25.9 North, longitude 62.4 West. Florence is moving toward the west-northwest near 13 mph (20 km/h). A west-northwestward to northward motion and an increase in forward speed are expected during the next couple of days. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the coast of North Carolina or South Carolina on Thursday.

Maximum sustained winds are near 140 mph (220 km/h) with higher gusts. Florence is a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Some strengthening is expected during the next 36 hours, and Florence is expected to be an extremely dangerous major hurricane through Thursday.

Hurricane-force winds extend outward up to 40 miles (65 km) from the center and tropical-storm-force winds extend outward up to 150 miles (240 km).

The latest minimum central pressure estimated from Air Force Reserve Hurricane Hunter aircraft data is 944 mb (27.88 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 500 AM AST.

Hurricane FLORENCE

ZCZC MIAPWSAT1 ALL

TTAA00 KNHC DDHHMM

HURRICANE FLORENCE WIND SPEED PROBABILITIES NUMBER 46

NWS NATIONAL HURRICANE CENTER MIAMI FL AL062018

2100 UTC MON SEP 10 2018

AT 2100Z THE CENTER OF HURRICANE FLORENCE WAS LOCATED NEAR LATITUDE
25.4 NORTH...LONGITUDE 61.1 WEST WITH MAXIMUM SUSTAINED WINDS NEAR
120 KTS...140 MPH...220 KM/H.

Z INDICATES COORDINATED UNIVERSAL TIME (GREENWICH)

ATLANTIC STANDARD TIME (AST)...SUBTRACT 4 HOURS FROM Z TIME

EASTERN DAYLIGHT TIME (EDT)...SUBTRACT 4 HOURS FROM Z TIME

CENTRAL DAYLIGHT TIME (CDT)...SUBTRACT 5 HOURS FROM Z TIME

WIND SPEED PROBABILITY TABLE FOR SPECIFIC LOCATIONS

CHANCES OF SUSTAINED (1-MINUTE AVERAGE) WIND SPEEDS OF AT LEAST

...34 KT (39 MPH... 63 KM/H)...

...50 KT (58 MPH... 93 KM/H)...

...64 KT (74 MPH...119 KM/H)...

FOR LOCATIONS AND TIME PERIODS DURING THE NEXT 5 DAYS

PROBABILITIES FOR LOCATIONS ARE GIVEN AS OP(CP) WHERE

OP IS THE PROBABILITY OF THE EVENT BEGINNING DURING

AN INDIVIDUAL TIME PERIOD (ONSET PROBABILITY)

(CP) IS THE PROBABILITY OF THE EVENT OCCURRING BETWEEN

18Z MON AND THE FORECAST HOUR (CUMULATIVE PROBABILITY)

PROBABILITIES ARE GIVEN IN PERCENT

X INDICATES PROBABILITIES LESS THAN 1 PERCENT

PROBABILITIES FOR 34 KT AND 50 KT ARE SHOWN AT A GIVEN LOCATION WHEN
THE 5-DAY CUMULATIVE PROBABILITY IS AT LEAST 3 PERCENT.

PROBABILITIES FOR 34...50...64 KT SHOWN WHEN THE 5-DAY
64-KT CUMULATIVE PROBABILITY IS AT LEAST 1 PERCENT.

BULLETIN

Hurricane Florence Advisory Number 46

NWS National Hurricane Center Miami FL 500 PM AST Mon Sep 10 2018

AL062018

...FLORENCE GROWING IN SIZE AND STRENGTH...

...HURRICANE AND STORM SURGE WATCHES COULD BE ISSUED TUESDAY

MORNING...

SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...25.4N 61.1W

ABOUT 525 MI...845 KM SSE OF BERMUDA

ABOUT 1170 MI...1880 KM ESE OF CAPE FEAR NORTH CAROLINA

MAXIMUM SUSTAINED WINDS...140 MPH...220 KM/H

PRESENT MOVEMENT...WNW OR 285 DEGREES AT 13 MPH...20 KM/H

MINIMUM CENTRAL PRESSURE...939 MB...27.73 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

Interests in the southeastern and mid-Atlantic states should monitor the progress of Florence. Storm Surge and Hurricane watches could be issued for portions of these areas by Tuesday morning.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the eye of Hurricane Florence was located near latitude 25.4 North, longitude 61.1 West. Florence is moving toward the west-northwest near 13 mph (20 km/h). This general motion with an increase in forward speed is expected during the next couple of days. A turn toward the northwest is forecast to occur late Wednesday night. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas Tuesday and Wednesday, and approach the coast of South Carolina or North Carolina on Thursday.

Data from a NOAA Hurricane Hunter aircraft indicate that maximum sustained winds have increased near 140 mph (220 km/h) with higher gusts. Florence is a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Further strengthening is anticipated, and Florence is expected to be an extremely dangerous major hurricane through Thursday.

Hurricane-force winds extend outward up to 40 miles (65 km) from the center and tropical-storm-force winds extend outward up to 150 miles (240 km).

The estimated minimum central pressure from NOAA Hurricane Hunter aircraft data is 939 mb (27.73 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 1100 PM AST.

Hurricane Florence Tropical Cyclone Update

NWS National Hurricane Center Miami FL 1200 PM AST Mon Sep 10 2018

AL062018

...FLORENCE BECOMES A CATEGORY FOUR HURRICANE...

Data from a NOAA Hurricane Hunter aircraft indicate that Florence has continued to rapidly strengthen and has maximum sustained winds near 130 mph (195 km/h). The latest minimum central pressure based on data from the aircraft is 946 mb (27.93 inches).

SUMMARY OF 1200 PM AST...1600 UTC...INFORMATION

LOCATION...25.0N 60.2W

ABOUT 575 MI...925 KM SSE OF BERMUDA

ABOUT 1230 MI...1985 KM ESE OF CAPE FEAR NORTH CAROLINA

MAXIMUM SUSTAINED WINDS...130 MPH...195 KM/H

PRESENT MOVEMENT...W OR 280 DEGREES AT 13 MPH...20 KM/H

MINIMUM CENTRAL PRESSURE...946 MB...27.93 INCHES

HURRICANE FLORENCE WIND SPEED PROBABILITIES NUMBER 43

NWS NATIONAL HURRICANE CENTER MIAMI FL AL062018

0300 UTC MON SEP 10 2018

AT 0300Z THE CENTER OF HURRICANE FLORENCE WAS LOCATED NEAR LATITUDE
24.6 NORTH...LONGITUDE 57.7 WEST WITH MAXIMUM SUSTAINED WINDS NEAR
80 KTS...90 MPH...150 KM/H.

Z INDICATES COORDINATED UNIVERSAL TIME (GREENWICH)

ATLANTIC STANDARD TIME (AST)...SUBTRACT 4 HOURS FROM Z TIME

EASTERN DAYLIGHT TIME (EDT)...SUBTRACT 4 HOURS FROM Z TIME

CENTRAL DAYLIGHT TIME (CDT)...SUBTRACT 5 HOURS FROM Z TIME

WIND SPEED PROBABILITY TABLE FOR SPECIFIC LOCATIONS

CHANCES OF SUSTAINED (1-MINUTE AVERAGE) WIND SPEEDS OF AT LEAST

...34 KT (39 MPH... 63 KM/H)...

...50 KT (58 MPH... 93 KM/H)...

...64 KT (74 MPH...119 KM/H)...

FOR LOCATIONS AND TIME PERIODS DURING THE NEXT 5 DAYS
 PROBABILITIES FOR LOCATIONS ARE GIVEN AS OP(CP) WHERE
 OP IS THE PROBABILITY OF THE EVENT BEGINNING DURING
 AN INDIVIDUAL TIME PERIOD (ONSET PROBABILITY)
 (CP) IS THE PROBABILITY OF THE EVENT OCCURRING BETWEEN
 00Z MON AND THE FORECAST HOUR (CUMULATIVE PROBABILITY)
 PROBABILITIES ARE GIVEN IN PERCENT
 X INDICATES PROBABILITIES LESS THAN 1 PERCENT
 PROBABILITIES FOR 34 KT AND 50 KT ARE SHOWN AT A GIVEN LOCATION WHEN
 THE 5-DAY CUMULATIVE PROBABILITY IS AT LEAST 3 PERCENT.
 PROBABILITIES FOR 34...50...64 KT SHOWN WHEN THE 5-DAY
 64-KT CUMULATIVE PROBABILITY IS AT LEAST 1 PERCENT.

BULLETIN

Hurricane Florence Advisory Number 45

NWS National Hurricane Center Miami FL 1100 AM AST Mon Sep 10 2018
AL062018

...FLORENCE RAPIDLY STRENGTHENS INTO A MAJOR HURRICANE...
SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...25.0N 60.0W
ABOUT 580 MI...935 KM SSE OF BERMUDA
ABOUT 1240 MI...2000 KM ESE OF CAPE FEAR NORTH CAROLINA
MAXIMUM SUSTAINED WINDS...115 MPH...185 KM/H
PRESENT MOVEMENT...W OR 280 DEGREES AT 13 MPH...20 KM/H
MINIMUM CENTRAL PRESSURE...962 MB...28.41 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.
Interests in the southeastern and mid-Atlantic states should monitor
the progress of Florence. Storm Surge and Hurricane watches could
be issued for portions of these areas by Tuesday morning.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the eye of Hurricane Florence was
located near latitude 25.0 North, longitude 60.0 West. Florence is
moving toward the west near 13 mph (20 km/h). A west-northwestward
motion with an increase in forward speed is expected during the next
couple of days. A turn toward the northwest is forecast to occur
late Wednesday night. On the forecast track, the center of Florence
will move over the southwestern Atlantic Ocean between Bermuda and
the Bahamas Tuesday and Wednesday, and approach the coast of South
Carolina or North Carolina on Thursday.
Satellite data indicate that maximum sustained winds have increased
to near 115 mph (185 km/h) with higher gusts. Florence is a
category 3 hurricane on the Saffir-Simpson Hurricane Wind Scale.
Further strengthening is anticipated, and Florence is expected to be
an extremely dangerous major hurricane through Thursday.
Hurricane-force winds extend outward up to 30 miles (45 km) from the
center and tropical-storm-force winds extend outward up to 140 miles
(220 km).

The estimated minimum central pressure is 962 mb (28.41 inches).

HAZARDS AFFECTING LAND

SURF: Swells generated by Florence are affecting Bermuda and
portions of the U.S. East Coast. These swells are likely to cause
life-threatening surf and rip current conditions. Please consult
products from your local weather office.

NEXT ADVISORY

Next complete advisory at 500 PM AST.

TTAA00 KNHC DDHHMM

Hurricane Florence Discussion Number 47

NWS National Hurricane Center Miami FL 1100 PM AST Mon Sep 10 2018

AL062018

The rapid intensification of Florence ended just after the last advisory, with the central pressure falling to near 939 mb. Since that time, the eyewall convection has become a bit ragged and the latest central pressure from the Air Force Reserve Hurricane Hunter aircraft is near 944 mb. The initial intensity will remain a possibly generous 120 kt for this advisory based on the aircraft winds. Microwave imagery suggests that Florence may be starting an eyewall replacement cycle. However, the winds from the Hurricane Hunter did not clearly indicate the presence of an outer eyewall. Florence should remain in a light shear environment and over sea surface temperatures near 29C for at least the next 48 h. Thus, there is little other than eyewall replacement cycles to keep the hurricane from intensifying further as indicated by all of the intensity guidance. The new intensity forecast calls for continued strengthening to near category 5 strength, although at a slower rate than what occurred during the last 30 h. Florence is expected to encounter southwesterly shear near the 72 h point, which could cause slight weakening before landfall. However, there remains high confidence that Florence will be a large and extremely dangerous hurricane, regardless of its exact intensity.

The initial motion is 290/11. A building mid-level ridge over the northwestern Atlantic is expected to steer Florence west-northwestward to northwestward with an increase in forward speed during the next 48 h. After that time, a marked decrease in forward speed is likely as another ridge builds over the Great Lakes to the north of Florence. The track guidance continues to show some spread between the ECMWF on the left side of the envelope and the GFS on the right side. Overall, though, the guidance has again shifted a little to the right, and the 72-96 h points are nudged just a little to the right from the previous forecast. It is important not to focus on the exact forecast track as average NHC errors at days 3, 4, and 5 are about 100, 140 and 180 n mi, respectively, and dangerous hazards will extend well away from the center.

The NOAA G-IV jet will continue to conduct synoptic surveillance missions every 12 h through at least Wednesday. In addition, special 0600 UTC and 1800 UTC radiosonde launches have been expanded to additional upper-air stations across the U.S. to collect extra data for the numerical models. The next Air Force Reserve Hurricane Hunter mission into Florence is scheduled for near 12Z.

Key Messages:

1. A life-threatening storm surge is likely along portions of the coastlines of South Carolina, North Carolina, and Virginia, and

a Storm Surge Watch will likely be issued for some of these areas by Tuesday morning. All interests from South Carolina into the mid-Atlantic region should ensure they have their hurricane plan in place and follow any advice given by local officials.

2. Life-threatening freshwater flooding is likely from a prolonged and exceptionally heavy rainfall event, which may extend inland over the Carolinas and Mid Atlantic for hundreds of miles as Florence is expected to slow down as it approaches the coast and moves inland.

3. Damaging hurricane-force winds are likely along portions of the coasts of South Carolina and North Carolina, and a Hurricane Watch will likely be issued by Tuesday morning. Damaging winds could also spread well inland into portions of the Carolinas and Virginia.

4. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week, resulting in life-threatening surf and rip currents.

Tropical Storm Florence Advisory Number 13

NWS National Hurricane Center Miami FL 1100 AM AST Sun Sep 02 2018

AL062018

...FLORENCE MOVING QUICKLY WEST-NORTHWESTWARD OVER THE OPEN EASTERN
ATLANTIC OCEAN...

SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...17.0N 33.2W

ABOUT 605 MI...970 KM WNW OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...50 MPH...85 KM/H

PRESENT MOVEMENT...WNW OR 285 DEGREES AT 18 MPH...30 KM/H

MINIMUM CENTRAL PRESSURE...1000 MB...29.53 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the center of Tropical Storm Florence was located near latitude 17.0 North, longitude 33.2 West. Florence is moving toward the west-northwest near 18 mph (30 km/h). A westward to west-northwestward motion at a similar forward speed is expected for the next few days.

Maximum sustained winds have decreased slightly to near 50 mph (85 km/h) with higher gusts. Little change in strength is forecast during the next few days.

Tropical-storm-force winds extend outward up to 45 miles (75 km) from the center.

The estimated minimum central pressure is 1000 mb (29.53 inches).
HAZARDS AFFECTING LAND

None.

NEXT ADVISORY

Next complete advisory at 500 PM AST.

Tropical Storm Florence Advisory Number 14

NWS National Hurricane Center Miami FL 500 PM AST Sun Sep 02 2018
AL062018

...FLORENCE MOVING WEST-NORTHWESTWARD WITH NO CHANGE IN STRENGTH...
SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...17.4N 34.6W
ABOUT 700 MI...1125 KM WNW OF THE SOUTHERNMOST CABO VERDE ISLANDS
MAXIMUM SUSTAINED WINDS...50 MPH...85 KM/H
PRESENT MOVEMENT...WNW OR 285 DEGREES AT 17 MPH...28 KM/H
MINIMUM CENTRAL PRESSURE...1000 MB...29.53 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the center of Tropical Storm Florence was located near latitude 17.4 North, longitude 34.6 West. Florence is moving toward the west-northwest near 17 mph (28 km/h). A west-northwestward to westward motion is expected to continue through Wednesday with a gradual decrease in forward speed. Maximum sustained winds are near 50 mph (85 km/h) with higher gusts. Little change in strength is forecast during the few days. Tropical-storm-force winds extend outward up to 60 miles (95 km) from the center. The estimated minimum central pressure is 1000 mb (29.53 inches).

HAZARDS AFFECTING LAND

None.

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 12

NWS National Hurricane Center Miami FL 500 AM AST Sun Sep 02 2018

AL062018

Florence continues to gradually strengthen. Microwave imagery from a recent AMSR overpass indicates that a majority of the deep convection is located in the northern semicircle of the tropical storm, but its center is still well embedded within the central dense overcast. A blend of satellite intensity estimates from SAB and TAFB supports increasing the intensity to 50 kt.

Some additional slight strengthening is still expected over the next day or so while Florence remains in a light shear environment and over marginal SSTs. Beginning in about 3 days, slow weakening is forecast due to an expected increase in wind shear associated with an extensive mid- to upper-level trough over the central Atlantic. The intensity guidance is in generally good agreement through 120 h, and the official forecast remains near the intensity consensus. The initial motion is now 290/13. The track guidance is fairly tightly packed for the first 48 h or so, with the spread increasing more quickly beyond that time. For the next couple of days, the subtropical ridge should keep Florence moving westward to west-northwestward at a similar forward speed. By day 3, a west-northwest to northwest motion is forecast to begin, as the aforementioned mid- to upper-level trough influences the track of the tropical storm. While all of the global models show this general scenario, the extent to which Florence will gain latitude is less certain. A stronger Florence will likely turn more toward the northwest, while a weaker, shallower system should continue on a more westward to west-northwestward track. For now, the NHC forecast remains near the middle of the guidance envelope, close to all of the consensus models. This track is also generally in line with the official intensity forecast, which shows a somewhat weaker system than the GFS (on the north side of the guidance), but a stronger one than the ECMWF (on the south side).

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 13

NWS National Hurricane Center Miami FL 1100 AM AST Sun Sep 02 2018
AL062018

Florence's convective cloud appearance has become rather disheveled this morning, with most of the deep convection sheared to the east and northeast of the now fully exposed but well-defined low-level circulation center. Both subjective and objective satellite intensity estimates have decreased, especially the objective ADT estimates from UW-CIMSS. Based on a blend of the available estimates, the intensity has been lowered to 45 kt.

The initial motion is 285/16. Now that the system has weakened and become more vertically shallow, a more westward component of motion is expected throughout the forecast period. All but the GFS and HWRF models have picked up on this more westerly component of motion, and the ECMWF and UKMET models are now the southernmost models in the guidance suite. Since the ridge to the north is expected to remain intact and even build more westward over the next 5 days, the new NHC track forecast has been shifted southward and to the left of the previous advisory track, and lies close to a blend of the HCCA, FSSE, and TCVN track consensus models.

Analyses from UW-CIMSS indicate that westerly to southwesterly vertical wind shear of 15-20 kt is undercutting the otherwise favorable upper-level outflow pattern noted in water vapor imagery and by the GFS- and ECMWF-based SHIPS model, which show the shear to be less than 10 kt. GOES-16 mid-level water vapor imagery also reveals that Florence is ingesting considerable dry air in the western and southern quadrants, with the dry mid-level air having penetrated into the inner-core region. Since the vertical shear is expected to get a little worse over the next 3-4 days while the cyclone is moving over SSTs near 26 deg C, little change in strength is forecast through 96 h. By 120 h, however, Florence is forecast to move over warmer waters with SSTs exceeding 28 deg C and also into a weaker shear environment, which should allow for some re-strengthening to occur. The new NHC intensity forecast is a little lower than the one in the previous advisory, and closely

follows the consensus model IVCN, through 96 h, and then is a little above the guidance at 120 h.

Tropical Storm FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 14

NWS National Hurricane Center Miami FL 500 PM AST Sun Sep 02 2018
AL062018

Florence's cloud pattern is characterized by a low-level center partially displaced to the west of the coldest cloud tops, which have expanded in coverage recently. A blend of the latest satellite classifications supports maintaining an intensity of 45 kt for this advisory package. Little change in strength is expected for much of the forecast period, as Florence will be moving through an environment characterized by moderate shear and marginal SSTs for the next 3 days. By the end of the forecast period, the SSTs begin to warm up, which should result in some restrengthening. The new NHC intensity forecast is similar to the previous one and is closest to the SHIPS model forecast.

The initial motion estimate is 285/15. Florence will be steered west-northwestward or westward for the next several days by the Atlantic subtropical ridge. There is a fair amount of north-south spread in the guidance, with the GFS, GEFS ensemble mean and HWRF on the right side of the envelope and the ECMWF, ECMWF mean and UKMET on the left. This spread is likely due to large differences in the vertical structure of the cyclone, with the ECMWF and UKMET having a much weaker vortex at 500 mb compared to the GFS in 3-4 days. Given the difficulty in forecasting these types of structural changes, the NHC forecast lies in the middle of the guidance envelope and is close to the multi-model consensus aids through the forecast period. This forecast is largely an update of the previous NHC prediction.

Tropical Storm FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 15

NWS National Hurricane Center Miami FL 1100 PM AST Sun Sep 02 2018

AL062018

Florence has generally changed little during the past several hours. The cloud pattern consists of a central dense overcast feature with the low-level center estimated to be closer to the southern side of the convection. All of the satellite intensity estimates have held steady and support maintaining the wind speed at 45 kt.

Although Florence is located in an environment of relatively low wind shear, the SSTs beneath the cyclone are cool, around 26 deg C. The tropical storm is expected to move over gradually warmer waters beginning in about 24 hours, but it will also be moving into an environment of higher shear. These mixed signals suggest that Florence will likely change little in intensity or weaken slightly during the next few days. By the end of the forecast period, however, the shear is expected to lessen and by then Florence should be over much warmer waters. Therefore, strengthening seems likely in the 4 to 5 day time period. The NHC intensity forecast is a little lower than the previous one to come into better agreement with the latest guidance.

Florence is moving west-northwestward at 15 kt steered by a mid-level ridge to its northeast. Although the track models all show a west-northwestward to northwestward motion during the next several days, the north-south spread becomes fairly large by the end of the forecast period. This spread appears to be primarily associated with differences on how strong or vertically coherent each model predicts Florence to be. Since the NHC forecast shows the storm changing little in strength for the next few days, this track prediction lies near the middle of the guidance envelope

close to the various consensus models.

TTAA00 KNHC DDHHMM

BULLETIN

Tropical Storm Florence Advisory Number 12

NWS National Hurricane Center Miami FL 500 AM AST Sun Sep 02 2018

...FLORENCE GRADUALLY STRENGTHENING...

AL062018

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...16.5N 31.4W

ABOUT 480 MI...770 KM WNW OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...60 MPH...95 KM/H

PRESENT MOVEMENT...WNW OR 290 DEGREES AT 15 MPH...24 KM/H

MINIMUM CENTRAL PRESSURE...999 MB...29.50 INCHES

WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Tropical Storm Florence was

located near latitude 16.5 North, longitude 31.4 West. Florence is moving toward the west-northwest near 15 mph (24 km/h). A westward to west-northwestward motion at a similar forward speed is expected for the next few days.

Maximum sustained winds have increased to near 60 mph (95 km/h) with higher gusts. Additional slow strengthening is possible today or tomorrow, but little overall change in strength is expected through Tuesday.

Tropical-storm-force winds extend outward up to 45 miles (75 km) from the center.

The estimated minimum central pressure is 999 mb (29.50 inches).

HAZARDS AFFECTING LAND

None.

NEXT ADVISORY

Next complete advisory at 1100 AM AST.

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 10

NWS National Hurricane Center Miami FL 500 PM AST Sat Sep 01 2018

AL062018

The cloud pattern has continued to improve with a circular area of convection near the center, and a cyclonically curved band surrounding the system. The upper-level outflow is fair in all quadrants. Although the cloud pattern is better organized, the Dvorak T-numbers have not changed, and only support 40 kt at this time.

Florence has a couple of more days embedded within a low-shear environment which supports strengthening, but it is also currently heading toward marginal SSTs. By the time the cyclone reaches warmer waters again, the shear is forecast to be unfavorable. The best option at this time is to show only a very modest strengthening at the rate indicated by the intensity consensus aids.

Florence has been moving toward the west-northwest or 285 degrees at 12 to 14 kt. No change in track is anticipated during the next 3 days while Florence is located to the south of the Atlantic subtropical ridge. After that time, Florence will reach a break in the ridge causing the cyclone to turn toward the northwest with a decrease in forward speed. The latter portion of the forecast is uncertain since the strength of the subtropical ridge to the north

has been fluctuating from run to run in each model. At this time, the overall guidance has been shifting a little bit westward, suggesting a stronger ridge. On this basis, the NHC forecast was adjusted slightly in that direction at the end of the forecast period.

FORECAST POSITIONS AND MAX WINDS

Tropical Storm FLORENCE

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Storm Florence Discussion Number 11

NWS National Hurricane Center Miami FL 1100 PM AST Sat Sep 01 2018

AL062018

Florence continues to become better organized, with a circular central dense overcast and a complex of outer bands in all quadrants except the southwest. Satellite intensity estimates range from 35-55 kt, and thus the initial intensity is increased to 45 kt. Given the overall good appearance in satellite imagery, it is possible this is conservative.

For the next 2 days or so, Florence should remain in a light shear environment over sea surface temperatures near 26C. Most of the guidance shows some slow strengthening, and the intensity forecast follows suit. After 48 h, the cyclone should reach warmer water and encounter southwesterly shear, and this combination is expected to result in little change in strength during this period. The intensity forecast is only slightly changed from the previous advisory and remains near the consensus aids. Considering the lack of shear and the good structure, though, it would not be surprising if Florence got a little stronger than forecast during the next couple of days.

The initial motion is 290/12. The track guidance suggests a general west-northwestward motion should continue for the next 3-4 days as Florence is steered by the subtropical ridge to the north. Near the end of the forecast period, a more northwestward motion

is expected. Despite the relatively straightforward steering pattern, there is a significant spread in the track guidance even by 72 h, with the Canadian model on the far right side of the guidance envelope, the ECMWF on the left side, and the other dynamical models loosely clustered in between. However, the overall guidance envelope has changed little since the last advisory, and the new track forecast lies near both the center of the envelope and the previous forecast.

BULLETIN

Tropical Storm Florence Advisory Number 8

NWS National Hurricane Center Miami FL 500 AM AST Sat Sep 01 2018

AL062018

...TROPICAL STORM FLORENCE FORMS JUST WEST OF THE CABO VERDE
ISLANDS...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...14.5N 26.7W

ABOUT 155 MI...250 KM W OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...40 MPH...65 KM/H

PRESENT MOVEMENT...WNW OR 285 DEGREES AT 14 MPH...22 KM/H

MINIMUM CENTRAL PRESSURE...1003 MB...29.62 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Cabo Verde Islands of Santiago, Fogo, and Brava

For storm information specific to your area, please monitor products
issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Tropical Storm Florence was located near latitude 14.5 North, longitude 26.7 West. Florence is moving toward the west-northwest near 14 mph (22 km/h), and this general motion is expected to continue through Tuesday. On the forecast track, the center of Florence will continue to move away from the Cabo Verde Islands today.

Maximum sustained winds have increased to near 40 mph (65 km/h) with higher gusts. Additional gradual strengthening is forecast during the next several days.

Tropical-storm-force winds extend outward up to 35 miles (55 km) from the center.

The estimated minimum central pressure is 1003 mb (29.62 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce an additional 1 to 2 inches of rain across the southern Cabo Verde Islands today.

WINDS: Tropical storm conditions are diminishing over the southern Cabo Verde Islands.

NEXT ADVISORY

Next intermediate advisory at 800 AM AST.

Next complete advisory at 1100 AM AST.

Tropical Storm FLORENCE

ZCZC MIATCPAT1 ALL
TTAA00 KNHC DDHHMM
BULLETIN

Tropical Storm Florence Advisory Number 10

NWS National Hurricane Center Miami FL 500 PM AST Sat Sep 01 2018
AL062018

...FLORENCE FORECAST TO REMAIN OVER WATER FOR THE NEXT 5 DAYS...
SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...15.6N 29.0W
ABOUT 310 MI...500 KM W OF THE SOUTHERNMOST CABO VERDE ISLANDS
MAXIMUM SUSTAINED WINDS...45 MPH...75 KM/H
PRESENT MOVEMENT...WNW OR 285 DEGREES AT 16 MPH...26 KM/H
MINIMUM CENTRAL PRESSURE...1002 MB...29.59 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the center of Tropical Storm Florence was located near latitude 15.6 North, longitude 29.0 West. Florence is moving toward the west-northwest near 16 mph (26 km/h), and this general motion is expected to continue through Tuesday.

Maximum sustained winds are near 45 mph (75 km/h) with higher gusts. Some slight strengthening is forecast during the next few days.

Tropical-storm-force winds extend outward up to 45 miles (75 km) from the center.

The estimated minimum central pressure is 1002 mb (29.59 inches).

HAZARDS AFFECTING LAND

None.

NEXT ADVISORY

Next complete advisory at 1100 PM AST.

BULLETIN

Tropical Storm Florence Advisory Number 11

NWS National Hurricane Center Miami FL 1100 PM AST Sat Sep 01 2018

AL062018

...FLORENCE A LITTLE STRONGER AS IT MOVES WEST-NORTHWESTWARD OVER
THE OPEN ATLANTIC...

SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...16.0N 30.2W

ABOUT 395 MI...635 KM WNW OF THE SOUTHERNMOST CABO VERDE ISLANDS
MAXIMUM SUSTAINED WINDS...50 MPH...85 KM/H
PRESENT MOVEMENT...WNW OR 290 DEGREES AT 14 MPH...22 KM/H
MINIMUM CENTRAL PRESSURE...1000 MB...29.53 INCHES
WATCHES AND WARNINGS

There are no coastal watches or warnings in effect.
DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Tropical Storm Florence was located near latitude 16.0 North, longitude 30.2 West. Florence is moving toward the west-northwest near 14 mph (22 km/h), and this general motion is expected to continue through Tuesday. Maximum sustained winds have increased to near 50 mph (85 km/h) with higher gusts. Additional slow strengthening is expected tonight and Sunday, with little change in strength expected Monday and Tuesday. Tropical-storm-force winds extend outward up to 45 miles (75 km) from the center. The estimated minimum central pressure is 1000 mb (29.53 inches).
HAZARDS AFFECTING LAND

None.

Tropical Storm Florence Discussion Number 8

NWS National Hurricane Center Miami FL 500 AM AST Sat Sep 01 2018
AL062018

A recent SSMIS microwave pass has revealed that the cyclone has become much better organized with more pronounced convective banding. Satellite intensity estimates are wide ranging, spanning from T1.5/25 kt from SAB to T3.4/53 kt from the UW-CIMSS ADT. Since the numbers overall have increased, and the structure has improved, the initial intensity is raised to 35 kt, in closest agreement to the TAFB estimate, but this could be conservative. This makes the depression Tropical Storm Florence, the sixth named storm of the season.

Florence is moving west-northwestward, or 285/12 kt, and should maintain this motion for the next 48 hours while traveling along the southern periphery of the subtropical ridge. After 48 hours, the

storm is expected to reach a break in the ridge, causing it to slow down and turn northwestward by day 5. The biggest change noted among the track models on this cycle was a westward shift in the overall guidance envelope. The European model, in particular, swung significantly to the left, showing a weaker Florence not feeling the break in the ridge quite as much. I'd like to see this trend continue before making a significant change to the forecast, so for now the updated NHC track prediction is only nudged westward. That said, the models appear to be trending away from a definitive recurvature scenario.

The environment is mixed with positives and negatives for Florence's strengthening. For the first 3 days, vertical shear over Florence should be quite low, but the cyclone will also be moving through a less-than-ideal thermodynamic environment with marginal sea surface temperatures and decreasing mid-level moisture. After 3 days, the thermodynamic environment should begin to improve, but then the shear is forecast to strengthen. These conflicting signals point to only gradual strengthening, and the suite of intensity models aren't too far off from one another, nor from the previous NHC forecast. For that reason, no significant changes were made in this forecast package.

BULLETIN

Tropical Depression Six Intermediate Advisory Number 7A

NWS National Hurricane Center Miami FL AL062018

200 AM AST Sat Sep 01 2018

...TROPICAL DEPRESSION BEGINNING TO MOVE AWAY FROM THE SOUTHERN
CABO VERDE ISLANDS...

SUMMARY OF 200 AM AST...0600 UTC...INFORMATION

LOCATION...14.4N 26.2W

ABOUT 125 MI...200 KM WSW OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...35 MPH...55 KM/H

PRESENT MOVEMENT...WNW OR 285 DEGREES AT 14 MPH...22 KM/H

MINIMUM CENTRAL PRESSURE...1004 MB...29.65 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Cabo Verde Islands of Santiago, Fogo, and Brava

For storm information specific to your area, please monitor products issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 200 AM AST (0600 UTC), the center of Tropical Depression Six was located near latitude 14.4 North, longitude 26.2 West. The depression is moving toward the west-northwest near 14 mph (22 km/h), and this general motion is expected to continue for the next several days. On the forecast track, the depression will begin to move away from the Cabo Verde Islands today. The system is then forecast to move west-northwestward over the open eastern Atlantic on Sunday and Monday and over the central Atlantic Tuesday and Wednesday.

Maximum sustained winds are near 35 mph (55 km/h) with higher gusts. Strengthening is forecast, and the depression is expected to become a tropical storm today.

The estimated minimum central pressure is 1004 mb (29.65 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce an additional 1 to 2 inches of rain across the southern Cabo Verde Islands today.

WINDS: Tropical storm conditions are expected to diminish over the southern Cabo Verde Islands during the next few hours.

NEXT ADVISORY

Next complete advisory at 500 AM AST.

Tropical Storm Florence Discussion Number 9

NWS National Hurricane Center Miami FL 1100 AM AST Sat Sep 01 2018

AL062018

Satellite images indicate that Florence's cloud pattern has improved in organization with the low-level center embedded within the convection, and a cyclonically curved band surrounding the system. A blend of subjective and objective Dvorak numbers from TAFB, SAB, and the UW-CIMMS yield an initial intensity of 40 kt.

My predecessor wrote a very clear explanation of the reasoning of his track and intensity forecasts, and I do not think I can improve on it. The environment continues to be mixed with favorable and unfavorable conditions for Florence to strengthen. Currently, the shear is low and favors strengthening, but the ocean along the cyclone's forecast path is cooler. The latter condition should inhibit significant intensification. After 3 days, the opposite is anticipated -- the ocean will be warmer, but the shear will likely be high. Only at the very long range could both factors become favorable. The best option at this time is to show only a gradual strengthening at the rate indicated by the intensity consensus aids. Florence is still moving toward the west-northwest or 295 degrees at 12 kt. No change in track is anticipated during the next 3 days while Florence is located to the south of the subtropical ridge. After that time, Florence will reach a break in the ridge causing the cyclone to turn toward the northwest with a decrease in forward speed. The confidence in the forecast is high during the next 3 days when the track guidance envelope is tightly packed. Thereafter, the confidence is not so high since the envelope widens and becomes bounded by the easternmost HWRF and the westernmost ECMWF models. Since the guidance envelope shifted a little bit westward, the NHC forecast was also adjusted slightly in that direction, primarily during the end of the forecast period.

HURRICANE FLORENCE FORECAST/ADVISORY NUMBER 50

NWS NATIONAL HURRICANE CENTER MIAMI FL 2100 UTC TUE SEP 11 2018

AL062018

CHANGES IN WATCHES AND WARNINGS WITH THIS ADVISORY...

A STORM SURGE WARNING HAS BEEN ISSUED FROM SOUTH SANTEE RIVER SOUTH CAROLINA TO DUCK NORTH CAROLINA AND THE ALBEMARLE AND PAMLICO SOUNDS...INCLUDING THE NEUSE AND PAMLICO RIVERS.

A HURRICANE WARNING HAS BEEN ISSUED FROM SOUTH SANTEE RIVER SOUTH CAROLINA TO DUCK NORTH CAROLINA AND THE ALBEMARLE AND PAMLICO SOUNDS.

A TROPICAL STORM WATCH HAS BEEN ISSUED FROM NORTH OF THE NORTH CAROLINA/VIRGINIA BORDER TO CAPE CHARLES LIGHT VIRGINIA AND FOR THE CHESAPEAKE BAY SOUTH OF NEW POINT COMFORT.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT...

A STORM SURGE WARNING IS IN EFFECT FOR...

* SOUTH SANTEE RIVER SOUTH CAROLINA TO DUCK NORTH CAROLINA

* ALBEMARLE AND PAMLICO SOUNDS...INCLUDING THE NEUSE AND PAMLICO RIVERS

A STORM SURGE WATCH IS IN EFFECT FOR...

* EDISTO BEACH SOUTH CAROLINA TO SOUTH SANTEE RIVER SOUTH CAROLINA

* NORTH OF DUCK NORTH CAROLINA TO THE NORTH CAROLINA/VIRGINIA BORDER

A HURRICANE WARNING IS IN EFFECT FOR...

* SOUTH SANTEE RIVER SOUTH CAROLINA TO DUCK NORTH CAROLINA

* ALBEMARLE AND PAMLICO SOUNDS

A HURRICANE WATCH IS IN EFFECT FOR...

* EDISTO BEACH SOUTH CAROLINA TO SOUTH SANTEE RIVER SOUTH CAROLINA

* NORTH OF DUCK NORTH CAROLINA TO THE NORTH CAROLINA/VIRGINIA BORDER

A TROPICAL STORM WATCH IS IN EFFECT FOR...

* NORTH OF THE NORTH CAROLINA/VIRGINIA BORDER TO CAPE CHARLES LIGHT VIRGINIA

* CHESAPEAKE BAY SOUTH OF NEW POINT COMFORT

INTERESTS ELSEWHERE IN THE SOUTHEASTERN AND MID-ATLANTIC STATES SHOULD MONITOR THE PROGRESS OF FLORENCE. ADDITIONAL WATCHES AND WARNINGS MAY BE REQUIRED TONIGHT OR WEDNESDAY.

A STORM SURGE WARNING MEANS THERE IS A DANGER OF LIFE-THREATENING INUNDATION...FROM RISING WATER MOVING INLAND FROM THE COASTLINE...

DURING THE NEXT 36 HOURS IN THE INDICATED LOCATIONS. FOR A DEPICTION OF AREAS AT RISK...PLEASE SEE THE NATIONAL WEATHER

SERVICE STORM SURGE WATCH/WARNING GRAPHIC...AVAILABLE AT HURRICANES.GOV. THIS IS A LIFE-THREATENING SITUATION. PERSONS

LOCATED WITHIN THESE AREAS SHOULD TAKE ALL NECESSARY ACTIONS TO PROTECT LIFE AND PROPERTY FROM RISING WATER AND THE POTENTIAL FOR OTHER DANGEROUS CONDITIONS. PROMPTLY FOLLOW EVACUATION AND OTHER INSTRUCTIONS FROM LOCAL OFFICIALS.

A STORM SURGE WATCH MEANS THERE IS A POSSIBILITY OF LIFE-THREATENING INUNDATION...FROM RISING WATER MOVING INLAND FROM THE COASTLINE...IN THE INDICATED LOCATIONS DURING THE NEXT 48 HOURS. A HURRICANE WARNING MEANS THAT HURRICANE CONDITIONS ARE EXPECTED SOMEWHERE WITHIN THE WARNING AREA. A WARNING IS TYPICALLY ISSUED 36 HOURS BEFORE THE ANTICIPATED FIRST OCCURRENCE OF TROPICAL-STORM-FORCE WINDS...CONDITIONS THAT MAKE OUTSIDE PREPARATIONS DIFFICULT OR DANGEROUS. PREPARATIONS TO PROTECT LIFE AND PROPERTY SHOULD BE RUSHED TO COMPLETION.

A HURRICANE WATCH MEANS THAT HURRICANE CONDITIONS ARE POSSIBLE WITHIN THE WATCH AREA. A WATCH IS TYPICALLY ISSUED 48 HOURS BEFORE THE ANTICIPATED FIRST OCCURRENCE OF TROPICAL-STORM-FORCE WINDS... CONDITIONS THAT MAKE OUTSIDE PREPARATIONS DIFFICULT OR DANGEROUS.

A TROPICAL STORM WATCH MEANS THAT TROPICAL STORM CONDITIONS ARE POSSIBLE WITHIN THE WATCH AREA...GENERALLY WITHIN 48 HOURS.

Hurricane Florence Advisory Number 48...Corrected

NWS National Hurricane Center Miami FL AL062018

500 AM AST Tue Sep 11 2018

Corrected time of next advisory

...HURRICANE AND STORM SURGE WATCHES ISSUED FOR PORTIONS OF THE
COASTS OF NORTH AND SOUTH CAROLINA...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...26.4N 64.1W

ABOUT 410 MI...660 KM S OF BERMUDA

ABOUT 975 MI...1570 KM ESE OF CAPE FEAR NORTH CAROLINA

MAXIMUM SUSTAINED WINDS...140 MPH...220 KM/H

PRESENT MOVEMENT...WNW OR 290 DEGREES AT 15 MPH...24 KM/H

MINIMUM CENTRAL PRESSURE...944 MB...27.88 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

A Storm Surge Watch has been issued for the east coast of the
United States from Edisto Beach, South Carolina northward to
the North Carolina-Virginia border, including the Pamlico and
Albemarle Sounds.

A Hurricane Watch has been issued for the east coast of the United
States from Edisto Beach, South Carolina, northward to the
North Carolina-Virginia border, including the Pamlico and Albemarle
Sounds.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Storm Surge Watch is in effect for...

- * Edisto Beach South Carolina to the North Carolina-Virginia border
- * Albemarle and Pamlico Sounds, including the Neuse and Pamlico

Rivers

A Hurricane Watch is in effect for...

- * Edisto Beach South Carolina to the North Carolina-Virginia border
- * Albemarle and Pamlico Sounds

Interests elsewhere in the southeastern and mid-Atlantic states should monitor the progress of Florence. Additional watches may be required later today.

A Storm Surge Watch means there is a possibility of life-threatening inundation, from rising water moving inland from the coastline, in the indicated locations during the next 48 hours. For a depiction of areas at risk, please see the National Weather Service Storm Surge Watch/Warning Graphic, available at hurricanes.gov.

A Hurricane Watch means that hurricane conditions are possible within the watch area. A watch is typically issued 48 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous.

For storm information specific to your area, including possible inland watches and warnings, please monitor products issued by your local National Weather Service forecast office.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the center of Hurricane Florence was located near latitude 26.4 North, longitude 64.1 West. Florence is moving toward the west-northwest near 15 mph (24 km/h). A west-northwestward to northwestward motion with a slight increase in forward speed are expected during the next couple of days. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas through Wednesday, and approach the coast of North Carolina or South Carolina on Thursday.

Maximum sustained winds are near 140 mph (220 km/h) with higher gusts. Florence is a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Some strengthening is expected during the next day or so, and Florence is expected to be an extremely dangerous major hurricane through Thursday night.

Hurricane-force winds extend outward up to 40 miles (65 km) from the center and tropical-storm-force winds extend outward up to 150 miles (240 km).

The estimated minimum central pressure is 944 mb (27.88 inches).

HAZARDS AFFECTING LAND

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. The water has the potential to reach the following heights above ground if peak surge occurs at the time of high tide...

Edisto Beach to Murrells Inlet...2-4 ft

Murrells Inlet to Cape Fear...4-6 ft

Cape Fear to Cape Lookout including The Neuse and Pamlico River...6-12 ft

Cape Lookout to Ocracoke Inlet...5-8 ft

Ocracoke Inlet to North Carolina/Virginia Border...3-5 ft

The deepest water will occur along the immediate coast in areas of onshore winds, where the surge will be accompanied by large and destructive waves. Surge-related flooding depends on the relative timing of the surge and the tidal cycle, and can vary greatly over short distances. For information specific to your area, please see products issued by your local National Weather Service forecast office.

RAINFALL: Florence is expected to produce total rainfall accumulations of 15 to 20 inches with isolated maxima to 30 inches near Florence's track over portions of North Carolina, Virginia, and northern South Carolina through Saturday. This rainfall may produce life-threatening flash flooding.

WIND: Hurricane conditions are possible within the watch area by late Thursday or Thursday night, with tropical storm conditions possible by Thursday morning.

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next intermediate advisory at 800 AM AST.

Next complete advisory at 1100 AM AST.

Hurricane Florence Discussion Number 50

NWS National Hurricane Center Miami FL 500 PM AST Tue Sep 11 2018
AL062018

Microwave satellite data indicate that Florence completed a full eyewall replacement cycle (ERC) a few hours ago, and recent visible and infrared imagery suggests that the eye has contracted slightly. Outflow continues to expand in all quadrants, and the outflow jets to the northwest and east have become better defined. Satellite intensity estimates from TAFB, SAB, and UW-CIMSS ADT are all T6.0/115 kt, and recent NHC objective intensity estimates are T6.2/120 kt. Given that the eye has mostly cleared out and has also warmed to near 19 deg C, the initial intensity has been bumped upward to 120 kt, which could be conservative. All of the wind radii had to be expanded/increased based on a blend of the earlier reconnaissance data and a 1430 UTC ASCAT scatterometer pass.

The initial motion estimate is now 300/15 kt. There remains no significant to the previous track forecast or reasoning. Overall, the global and regional models have done a good job capturing the evolving synoptic- scale flow pattern across CONUS, with an amplifying trough moving onshore the the northwestern U.S. coast, which is inducing downstream ridging across the northeastern U.S. and the northwestern Atlantic Ocean. Water vapor imagery indicates that the blocking high pressure northwest of Bermuda is continuing to build and shift slowly eastward. The 12Z GFS model made a significant shift to the west, the UKMET made a shift to the east, and the ECMWF track has remained basically unchanged through 72 hours. As a result the consensus models have made only minor track shifts to the west. What is noticeable is that all of the global and regional models are indicating that the steering currents will collapse by 72 h when Florence is approaching the southeast U.S. coast. The weak steering currents are expected to continue through the weekend, which makes the forecast track on days 3-5 quite uncertain. The latest NHC forecast track is very similar to the previous two advisory tracks, and lies the middle of the guidance envelope between the consensus models TVCA to the north and the HCCA and FSSE models to the south.

During the next 24 hours or so, Florence is expected to remain in a very favorable environment consisting of low shear near 5 kt, an expanding upper-level outflow pattern, and above-average SSTs of 29.0-29.5 deg C, which should result in additional strengthening. By 48 h, the decreasing forward speed along with the large inner-core wind field should induce some upwelling and gradual weakening. Although the GFS- and ECMWF-based SHIPS intensity models are indicating an increase in the southwesterly shear to near 20 kt, this could be due to the SHIPS model capturing Florence's own strong outflow from the GFS and ECMWF model fields. Despite the weakening shown at 72 hours, Florence is still expected to remain a dangerous hurricane through landfall. After Florence moves inland, the slow forward speed of less than 5 kt should cause a rapid spin down and weakening of the hurricane's circulation. The new NHC intensity forecast is a little above the highest guidance based on the aforementioned very favorable synoptic outflow pattern, and to maintain continuity with the previous forecast.

Key Messages:

1. A life-threatening storm surge is now highly likely along portions of the coastlines of South Carolina and North Carolina, and a Storm Surge Warning is in effect for a portion of this area. All interests from South Carolina into the mid-Atlantic region should ensure they have their hurricane plan in place and follow any advice given by local officials.
2. Life-threatening, catastrophic flash flooding and significant river flooding is likely over portions of the Carolinas and Mid-Atlantic states from late this week into early next week, as Florence is expected to slow down as it approaches the coast and moves inland.
3. Damaging hurricane-force winds are likely along portions of the coasts of South Carolina and North Carolina, and a Hurricane Warning has been issued for a part of this area. Damaging winds could also spread well inland into portions of the Carolinas and Virginia.

4. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week, resulting in life-threatening surf and rip currents.

TTAA00 KNHC DDHHMM

Hurricane Florence Discussion Number 51

NWS National Hurricane Center Miami FL 1100 PM AST Tue Sep 11 2018

AL062018

Florence's eye became a little ragged in appearance on satellite images a couple of hours ago, but recently it has become better defined. There has also been a little cooling of the tops surrounding the eye. These features suggest that Florence is maintaining its intensity. The current intensity is kept at 120 kt, which is a little above the adjusted flight-level winds from the Air Force Hurricane Hunters and a little below the latest SATCON estimate from UW-CIMSS. Over the next couple of days, the hurricane is expected to move over a warm ocean and through an environment of low vertical shear. This would allow some additional strengthening until about 48 hours. From that time and up to landfall, the global models suggest some increase in shear which would cause some weakening. However, Florence is still likely to remain a dangerous major hurricane when its center crosses the coast. The official intensity forecast is a blend of the Decay-SHIPS and ICON intensity model consensus.

The initial motion estimate is west-northwestward, or 300/15 kt. A mid-level ridge to the northeast should continue to steer Florence on a west-northwestward to northwestward heading until the hurricane nears the coast. The steering pattern from 72 hours and beyond becomes more complicated and uncertain. The latest GFS model run shows a mid-level ridge building over the east-central United States in 3-4 days. This temporarily blocks the forward progress of the hurricane and forces a southwesterly turn in the

model run. Later in the period, the ridge rebuilds to the north of Florence allowing the system to move inland. The official track forecast is somewhat to the left of the previous NHC track, but to the right of the latest consensus predictions. It should be noted that, due to increased model spread, there is substantial uncertainty in the 3-5 track forecast.

It is important for users to realize that significant impacts extend well away from the center of Florence, and serious hazards such as a dangerous storm surge and flooding rains will cover a large area regardless of exactly where the center moves.

Key Messages:

1. A life-threatening storm surge is now highly likely along portions of the coastlines of South Carolina and North Carolina, and a Storm Surge Warning is in effect for a portion of this area. All interests from South Carolina into the mid-Atlantic region should complete preparations and follow any advice given by local officials.
2. Life-threatening, catastrophic flash flooding and significant river flooding is likely over portions of the Carolinas and Mid-Atlantic states from late this week into early next week, as Florence is expected to slow down as it approaches the coast and moves inland.
3. Damaging hurricane-force winds are likely along portions of the coasts of South Carolina and North Carolina, and a Hurricane Warning has been issued for a part of this area. Damaging winds could also spread well inland into portions of the Carolinas and Virginia.
4. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week, resulting in life-threatening surf and rip currents.

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

A Storm Surge Watch has been issued for the east coast of the United States from Edisto Beach, South Carolina northward to the North Carolina-Virginia border, including the Pamlico and Albemarle Sounds.

A Hurricane Watch has been issued for the east coast of the United States from Edisto Beach, South Carolina, northward to the North Carolina-Virginia border, including the Pamlico and Albemarle Sounds.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Storm Surge Watch is in effect for...

- * Edisto Beach South Carolina to the North Carolina-Virginia border
- * Albemarle and Pamlico Sounds, including the Neuse and Pamlico Rivers

A Hurricane Watch is in effect for...

- * Edisto Beach South Carolina to the North Carolina-Virginia border
- * Albemarle and Pamlico Sounds

Interests elsewhere in the southeastern and mid-Atlantic states should monitor the progress of Florence. Additional watches may be required later today.

A Storm Surge Watch means there is a possibility of life-threatening inundation, from rising water moving inland from the coastline, in the indicated locations during the next 48 hours. For a depiction of areas at risk, please see the National Weather Service Storm Surge Watch/Warning Graphic, available at hurricanes.gov.

A Hurricane Watch means that hurricane conditions are possible within the watch area. A watch is typically issued 48 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous.

For storm information specific to your area, including possible inland watches and warnings, please monitor products issued by your local National Weather Service forecast office.

DISCUSSION AND OUTLOOK

At 800 AM AST (1200 UTC), the center of Hurricane Florence was located near latitude 26.4 North, longitude 64.6 West. Florence is moving toward the west-northwest near 15 mph (24 km/h). A west-

northwestward to northwestward motion with a slight increase in forward speed are expected during the next couple of days. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas through Wednesday, and approach the coast of North Carolina or South Carolina on Thursday.

Reports from an Air Force Reserve Unit hurricane hunter aircraft indicate that maximum sustained winds have decreased to near 130 mph (215 km/h) with higher gusts. However, Florence is still a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Re-strengthening is forecast to occur during the next day or so, and Florence is expected to be an extremely dangerous major hurricane through Thursday night.

Hurricane-force winds extend outward up to 40 miles (65 km) from the center and tropical-storm-force winds extend outward up to 150 miles (240 km).

Data from the reconnaissance aircraft indicate that the minimum central pressure is 950 mb (28.05 inches).

HAZARDS AFFECTING LAND

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. The water has the potential to reach the following heights above ground if peak surge occurs at the time of high tide...

Edisto Beach to Murrells Inlet...2-4 ft

Murrells Inlet to Cape Fear...4-6 ft

Cape Fear to Cape Lookout including The Neuse and Pamlico River...6-12 ft

Cape Lookout to Ocracoke Inlet...5-8 ft

Ocracoke Inlet to North Carolina/Virginia Border...3-5 ft

The deepest water will occur along the immediate coast in areas of onshore winds, where the surge will be accompanied by large and destructive waves. Surge-related flooding depends on the relative timing of the surge and the tidal cycle, and can vary greatly over short distances. For information specific to your area, please see products issued by your local National Weather Service forecast office.

RAINFALL: Florence is expected to produce total rainfall accumulations of 15 to 20 inches with isolated maxima to 30 inches near Florence's track over portions of North Carolina, Virginia, and northern South Carolina through Saturday. This rainfall may produce life-threatening flash flooding.

WIND: Hurricane conditions are possible within the watch area by late Thursday or Thursday night, with tropical storm conditions possible by Thursday morning.

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

BULLETIN

Hurricane Florence Advisory Number 51

NWS National Hurricane Center Miami FL 1100 PM AST Tue Sep 11 2018

AL062018

...DANGEROUS FLORENCE EXPECTED TO BRING LIFE-THREATENING STORM SURGE
AND RAINFALL TO PORTIONS OF THE CAROLINAS AND MID-ATLANTIC STATES...

SUMMARY OF 1100 PM AST...0300 UTC...INFORMATION

LOCATION...28.4N 68.7W

ABOUT 355 MI...570 KM SW OF BERMUDA

ABOUT 670 MI...1075 KM ESE OF CAPE FEAR NORTH CAROLINA

MAXIMUM SUSTAINED WINDS...140 MPH...220 KM/H

PRESENT MOVEMENT...WNW OR 300 DEGREES AT 17 MPH...28 KM/H

MINIMUM CENTRAL PRESSURE...946 MB...27.93 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Storm Surge Warning is in effect for...

* South Santee River South Carolina to Duck North Carolina

* Albemarle and Pamlico Sounds, including the Neuse and Pamlico
Rivers

A Storm Surge Watch is in effect for...

* Edisto Beach South Carolina to South Santee River South Carolina

* North of Duck North Carolina to the North Carolina/Virginia border

A Hurricane Warning is in effect for...

* South Santee River South Carolina to Duck North Carolina

* Albemarle and Pamlico Sounds

A Hurricane Watch is in effect for...

* Edisto Beach South Carolina to South Santee River South Carolina

* North of Duck North Carolina to the North Carolina/Virginia border

A Tropical Storm Watch is in effect for...

* North of the North Carolina/Virginia border to Cape Charles Light Virginia

* Chesapeake Bay south of New Point Comfort

Interests elsewhere in the southeastern and mid-Atlantic states should monitor the progress of Florence.

A Storm Surge Warning means there is a danger of life-threatening inundation, from rising water moving inland from the coastline, during the next 36 hours in the indicated locations. For a depiction of areas at risk, please see the National Weather Service Storm Surge Watch/Warning Graphic, available at hurricanes.gov. This is a life-threatening situation. Persons located within these areas should take all necessary actions to protect life and property from rising water and the potential for other dangerous conditions. Promptly follow evacuation and other instructions from local officials.

A Storm Surge Watch means there is a possibility of life-threatening inundation, from rising water moving inland from the coastline, in the indicated locations during the next 48 hours.

A Hurricane Warning means that hurricane conditions are expected somewhere within the warning area. A warning is typically issued 36 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous. Preparations to protect life and property should be rushed to completion.

A Hurricane Watch means that hurricane conditions are possible within the watch area. A watch is typically issued 48 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous.

A Tropical Storm Watch means that tropical storm conditions are possible within the watch area, generally within 48 hours.

For storm information specific to your area, including possible inland watches and warnings, please monitor products issued by your local National Weather Service forecast office.

DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the eye of Hurricane Florence was located near latitude 28.4 North, longitude 68.7 West. Florence is moving toward the west-northwest near 17 mph (28 km/h). A motion toward the west-northwest and northwest is expected through early Thursday. Florence is expected to slow down considerably by late Thursday into Friday. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas through Wednesday, and approach the coast of North Carolina or South Carolina in the hurricane warning area on Thursday and Friday.

Maximum sustained winds are near 140 mph (220 km/h) with higher gusts. Florence is a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Strengthening is forecast through Wednesday.

While some weakening is expected on Thursday, Florence is forecast to be an extremely dangerous major hurricane through landfall. Hurricane-force winds extend outward up to 60 miles (95 km) from the center and tropical-storm-force winds extend outward up to 175 miles (280 km).

The minimum central pressure reported by an Air Force Hurricane Hunter aircraft is 946 mb (27.93 inches).

HAZARDS AFFECTING LAND

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. The water has the potential to reach the following heights above ground if peak surge occurs at the time of high tide...

Cape Fear to Cape Lookout, including the Neuse, Pamlico, Pungo, and Bay Rivers...9-13 ft

North Myrtle Beach to Cape Fear...6-9 ft

Cape Lookout to Ocracoke Inlet...6-9 ft

South Santee River to North Myrtle Beach...4-6 ft

Ocracoke Inlet to North Carolina/Virginia Border...4-6 ft

Edisto Beach to South Santee River...2-4 ft

The deepest water will occur along the immediate coast in areas of onshore winds, where the surge will be accompanied by large and destructive waves. Surge-related flooding depends on the relative timing of the surge and the tidal cycle, and can vary greatly over short distances. For information specific to your area, please see products issued by your local National Weather Service forecast office.

RAINFALL: Florence is expected to produce total rainfall accumulations of 15 to 25 inches with isolated maximum amounts of 35 inches near the storm's track over portions of the Carolinas and Mid-Atlantic States from late this week into early next week. This rainfall would produce catastrophic flash flooding and significant river flooding.

WIND: Hurricane conditions are expected to reach the coast within the hurricane warning area on Friday. Winds are expected to first reach tropical storm strength on Thursday, making outside preparations difficult or dangerous. Preparations to protect life and property should be rushed to completion.

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

BULLETIN

Hurricane Florence Advisory Number 49

NWS National Hurricane Center Miami FL 1100 AM AST Tue Sep 11 2018

AL062018

...FLORENCE EXPECTED TO RESTRENGTHEN LATER TODAY...

...LIFE-THREATENING STORM SURGE POSSIBLE ALONG THE COASTS OF NORTH
AND SOUTH CAROLINA...

SUMMARY OF 1100 AM AST...1500 UTC...INFORMATION

LOCATION...26.7N 65.3W

ABOUT 390 MI...625 KM S OF BERMUDA

ABOUT 905 MI...1455 KM ESE OF CAPE FEAR NORTH CAROLINA

MAXIMUM SUSTAINED WINDS...130 MPH...215 KM/H

PRESENT MOVEMENT...WNW OR 295 DEGREES AT 16 MPH...26 KM/H

MINIMUM CENTRAL PRESSURE...950 MB...28.06 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Storm Surge Watch is in effect for...

* Edisto Beach South Carolina to the North Carolina-Virginia border

* Albemarle and Pamlico Sounds, including the Neuse and Pamlico
Rivers

A Hurricane Watch is in effect for...

* Edisto Beach South Carolina to the North Carolina-Virginia border

* Albemarle and Pamlico Sounds

Interests elsewhere in the southeastern and mid-Atlantic states
should monitor the progress of Florence. Additional watches may be
required later today.

A Storm Surge Watch means there is a possibility of life-
threatening inundation, from rising water moving inland from the
coastline, in the indicated locations during the next 48 hours.
For a depiction of areas at risk, please see the National Weather
Service Storm Surge Watch/Warning Graphic, available at
hurricanes.gov.

A Hurricane Watch means that hurricane conditions are possible
within the watch area. A watch is typically issued 48 hours
before the anticipated first occurrence of tropical-storm-force
winds, conditions that make outside preparations difficult or
dangerous.

For storm information specific to your area, including possible
inland watches and warnings, please monitor products issued by your
local National Weather Service forecast office.

DISCUSSION AND OUTLOOK

At 1100 AM AST (1500 UTC), the center of Hurricane Florence was located near latitude 26.7 North, longitude 65.3 West. Florence is moving toward the west-northwest near 16 mph (26 km/h). A west-northwestward to northwestward motion with a slight increase in forward speed are expected during the next couple of days. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas through Wednesday, and approach the coast of North Carolina or South Carolina in the hurricane watch area Thursday and Friday. Maximum sustained winds are near 130 mph (215 km/h) with higher gusts. Florence is a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Florence is expected to begin re-strengthening later today and continue a slow strengthening trend for the next day or so. While some weakening is expected on Thursday, Florence is expected to be an extremely dangerous major hurricane through landfall.

Hurricane-force winds extend outward up to 40 miles (65 km) from the center and tropical-storm-force winds extend outward up to 150 miles (240 km).

The estimated minimum central pressure is 950 mb (28.06 inches).

HAZARDS AFFECTING LAND

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. The water has the potential to reach the following heights above ground if peak surge occurs at the time of high tide...

Edisto Beach to Murrells Inlet...2-4 ft

Murrells Inlet to Cape Fear...4-6 ft

Cape Fear to Cape Lookout including The Neuse and Pamlico River...6-12 ft

Cape Lookout to Ocracoke Inlet...5-8 ft

Ocracoke Inlet to North Carolina/Virginia Border...3-5 ft

The deepest water will occur along the immediate coast in areas of onshore winds, where the surge will be accompanied by large and destructive waves. Surge-related flooding depends on the relative timing of the surge and the tidal cycle, and can vary greatly over short distances. For information specific to your area, please see products issued by your local National Weather Service forecast office.

RAINFALL: Florence is expected to produce total rainfall accumulations of 15 to 20 inches with isolated maximum amounts to 30 inches near the storm's track over portions of the Carolinas and Mid-Atlantic States from late this week into early next week. This rainfall could produce catastrophic flash flooding and significant river flooding.

WIND: Hurricane conditions are possible within the watch area by late Thursday or Thursday night, with tropical storm conditions possible by Thursday morning.

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

A Hurricane Watch is in effect for...

- * Edisto Beach South Carolina to the North Carolina-Virginia border
- * Albemarle and Pamlico Sounds

Interests elsewhere in the southeastern and mid-Atlantic states should monitor the progress of Florence. Additional watches may be required later today.

A Storm Surge Watch means there is a possibility of life-threatening inundation, from rising water moving inland from the coastline, in the indicated locations during the next 48 hours. For a depiction of areas at risk, please see the National Weather Service Storm Surge Watch/Warning Graphic, available at

hurricanes.gov.

A Hurricane Watch means that hurricane conditions are possible within the watch area. A watch is typically issued 48 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous.

For storm information specific to your area, including possible inland watches and warnings, please monitor products issued by your local National Weather Service forecast office.

DISCUSSION AND OUTLOOK

At 200 PM AST (1800 UTC), the eye of Hurricane Florence was located near latitude 27.1 North, longitude 66.2 West. Florence is moving toward the west-northwest near 17 mph (28 km/h). A west-northwestward to northward motion with a slight increase in forward speed are expected during the next couple of days. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas through Wednesday, and approach the coast of North Carolina or South Carolina in the hurricane watch area Thursday and Friday. Maximum sustained winds are near 130 mph (215 km/h) with higher gusts. Florence is a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Florence is expected to begin re-strengthening later today and continue a slow strengthening trend for the next day or so. While some weakening is expected on Thursday, Florence is expected to be an extremely dangerous major hurricane through landfall.

Hurricane-force winds have expanded outward and now extend up to 60 miles (95 km) from the center. Tropical-storm-force winds have also expanded and now extend outward up to 170 miles (280 km) from the center.

The estimated minimum central pressure is 950 mb (28.06 inches).

HAZARDS AFFECTING LAND

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. The water has the potential to reach the following heights above ground if peak surge occurs at the time of high tide...

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

A Storm Surge Warning has been issued from South Santee River, South Carolina, to Duck, North Carolina, and the Albemarle and Pamlico Sounds, including the Neuse and Pamlico Rivers.

A Hurricane Warning has been issued from South Santee River, South Carolina, to Duck, North Carolina, and the Albemarle and Pamlico Sounds.

A Tropical Storm Watch has been issued from north of the North

Carolina/Virginia border to Cape Charles Light, Virginia, and for the Chesapeake Bay south of New Point Comfort.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Storm Surge Warning is in effect for...

- * South Santee River South Carolina to Duck North Carolina
- * Albemarle and Pamlico Sounds, including the Neuse and Pamlico Rivers

A Storm Surge Watch is in effect for...

- * Edisto Beach South Carolina to South Santee River South Carolina
- * North of Duck North Carolina to the North Carolina/Virginia border

A Hurricane Warning is in effect for...

- * South Santee River South Carolina to Duck North Carolina
- * Albemarle and Pamlico Sounds

A Hurricane Watch is in effect for...

- * Edisto Beach South Carolina to South Santee River South Carolina
- * North of Duck North Carolina to the North Carolina/Virginia border

A Tropical Storm Watch is in effect for...

- * North of the North Carolina/Virginia border to Cape Charles Light Virginia

- * Chesapeake Bay south of New Point Comfort

Interests elsewhere in the southeastern and mid-Atlantic states should monitor the progress of Florence. Additional watches and warnings may be required tonight or Wednesday.

A Storm Surge Warning means there is a danger of life-threatening inundation, from rising water moving inland from the coastline, during the next 36 hours in the indicated locations. For a depiction of areas at risk, please see the National Weather Service Storm Surge Watch/Warning Graphic, available at hurricanes.gov. This is a life-threatening situation. Persons located within these areas should take all necessary actions to protect life and property from rising water and the potential for other dangerous conditions. Promptly follow evacuation and other instructions from local officials.

A Storm Surge Watch means there is a possibility of life-threatening inundation, from rising water moving inland from the coastline, in the indicated locations during the next 48 hours.

A Hurricane Warning means that hurricane conditions are expected somewhere within the warning area. A warning is typically issued 36 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous. Preparations to protect life and property should be rushed to completion.

A Hurricane Watch means that hurricane conditions are possible within the watch area. A watch is typically issued 48 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous.

A Tropical Storm Watch means that tropical storm conditions are possible within the watch area, generally within 48 hours. For storm information specific to your area, including possible inland watches and warnings, please monitor products issued by your local National Weather Service forecast office.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the center of the eye of Hurricane Florence was located by satellite near latitude 27.5 North, longitude 67.1 West. Florence is moving toward the west-northwest near 17 mph (28 km/h). A motion toward the west-northwest and northwest is expected through early Thursday. Florence is expected to slow down considerably by late Thursday into Friday. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas through Wednesday, and approach the coast of North Carolina or South Carolina in the hurricane warning area on Thursday and Friday. Maximum sustained winds have increased to near 140 mph (220 km/h) with higher gusts. Florence is a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Further strengthening is forecast tonight and Wednesday. While some weakening is expected on Thursday, Florence is forecast to be an extremely dangerous major hurricane through landfall. Hurricane-force winds extend outward up to 60 miles (95 km) from the center and tropical-storm-force winds extend outward up to 175 miles (280 km).

The estimated minimum central pressure is 945 mb (27.91 inches).

HAZARDS AFFECTING LAND

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. The water has the potential to reach the following heights above ground if peak surge occurs at the time of high tide...

Cape Fear to Cape Lookout, including the Neuse and Pamlico Rivers...9-13 ft

North Myrtle Beach to Cape Fear...6-9 ft

Cape Lookout to Ocracoke Inlet...6-9 ft

South Santee River to North Myrtle Beach...4-6 ft

Ocracoke Inlet to North Carolina/Virginia Border...4-6 ft

Edisto Beach to South Santee River...2-4 ft

The deepest water will occur along the immediate coast in areas of onshore winds, where the surge will be accompanied by large and destructive waves. Surge-related flooding depends on the relative timing of the surge and the tidal cycle, and can vary greatly over short distances. For information specific to your area, please see products issued by your local National Weather Service forecast office.

RAINFALL: Florence is expected to produce total rainfall accumulations of 15 to 25 inches with isolated maximum amounts of 35 inches near the storm's track over portions of the Carolinas and Mid-Atlantic States from late this week into early next week. This rainfall would produce catastrophic flash flooding and significant river flooding.

WIND: Hurricane conditions are expected to reach the coast within the hurricane warning area on Friday. Winds are expected to first reach tropical storm strength on Thursday, making outside preparations difficult or dangerous. Preparations to protect life and property should be rushed to completion.

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause

life-threatening surf and rip current conditions. Please consult products from your local weather office.

HURRICANE FLORENCE FORECAST/ADVISORY NUMBER 49

NWS NATIONAL HURRICANE CENTER MIAMI FL 1500 UTC TUE SEP 11 2018

AL062018

CHANGES IN WATCHES AND WARNINGS WITH THIS ADVISORY...

NONE.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT...

A STORM SURGE WATCH IS IN EFFECT FOR...

* EDISTO BEACH SOUTH CAROLINA TO THE NORTH CAROLINA-VIRGINIA BORDER

* ALBEMARLE AND PAMLICO SOUNDS...INCLUDING THE NEUSE AND PAMLICO

RIVERS

A HURRICANE WATCH IS IN EFFECT FOR...

* EDISTO BEACH SOUTH CAROLINA TO THE NORTH CAROLINA-VIRGINIA BORDER

* ALBEMARLE AND PAMLICO SOUNDS

INTERESTS ELSEWHERE IN THE SOUTHEASTERN AND MID-ATLANTIC STATES

SHOULD MONITOR THE PROGRESS OF FLORENCE. ADDITIONAL WATCHES MAY BE

REQUIRED LATER TODAY.

A STORM SURGE WATCH MEANS THERE IS A POSSIBILITY OF LIFE-

THREATENING INUNDATION...FROM RISING WATER MOVING INLAND FROM THE

COASTLINE...IN THE INDICATED LOCATIONS DURING THE NEXT 48 HOURS.
FOR A DEPICTION OF AREAS AT RISK...PLEASE SEE THE NATIONAL WEATHER
SERVICE STORM SURGE WATCH/WARNING GRAPHIC...AVAILABLE AT
HURRICANES.GOV.

A HURRICANE WATCH MEANS THAT HURRICANE CONDITIONS ARE POSSIBLE
WITHIN THE WATCH AREA. A WATCH IS TYPICALLY ISSUED 48 HOURS
BEFORE THE ANTICIPATED FIRST OCCURRENCE OF TROPICAL-STORM-FORCE
WINDS... CONDITIONS THAT MAKE OUTSIDE PREPARATIONS DIFFICULT OR
DANGEROUS.

HURRICANE CENTER LOCATED NEAR 26.7N 65.3W AT 11/1500Z
POSITION ACCURATE WITHIN 15 NM
PRESENT MOVEMENT TOWARD THE WEST-NORTHWEST OR 295 DEGREES AT 14 KT

BULLETIN

Hurricane Florence Intermediate Advisory Number 50A

NWS National Hurricane Center Miami FL AL062018

800 PM AST Tue Sep 11 2018

...DANGEROUS FLORENCE HEADED FOR THE U.S. EAST COAST...

...EXPECTED TO BRING LIFE-THREATENING STORM SURGE AND RAINFALL TO
PORTIONS OF THE CAROLINAS AND MID-ATLANTIC STATES...

SUMMARY OF 800 PM AST...0000 UTC...INFORMATION

LOCATION...28.0N 67.9W

ABOUT 350 MI...565 KM SSW OF BERMUDA

ABOUT 725 MI...1165 KM ESE OF CAPE FEAR NORTH CAROLINA

MAXIMUM SUSTAINED WINDS...140 MPH...220 KM/H

PRESENT MOVEMENT...WNW OR 300 DEGREES AT 17 MPH...28 KM/H

MINIMUM CENTRAL PRESSURE...945 MB...27.91 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Storm Surge Warning is in effect for...

* South Santee River South Carolina to Duck North Carolina

* Albemarle and Pamlico Sounds, including the Neuse and Pamlico
Rivers

A Storm Surge Watch is in effect for...

* Edisto Beach South Carolina to South Santee River South Carolina

* North of Duck North Carolina to the North Carolina/Virginia border

A Hurricane Warning is in effect for...

* South Santee River South Carolina to Duck North Carolina

* Albemarle and Pamlico Sounds

A Hurricane Watch is in effect for...

* Edisto Beach South Carolina to South Santee River South Carolina

* North of Duck North Carolina to the North Carolina/Virginia border

A Tropical Storm Watch is in effect for...

* North of the North Carolina/Virginia border to Cape Charles Light
Virginia

* Chesapeake Bay south of New Point Comfort

Interests elsewhere in the southeastern and mid-Atlantic states

should monitor the progress of Florence. Additional watches and warnings may be required tonight or Wednesday.

A Storm Surge Warning means there is a danger of life-threatening inundation, from rising water moving inland from the coastline, during the next 36 hours in the indicated locations. For a depiction of areas at risk, please see the National Weather Service Storm Surge Watch/Warning Graphic, available at hurricanes.gov. This is a life-threatening situation. Persons located within these areas should take all necessary actions to protect life and property from rising water and the potential for other dangerous conditions. Promptly follow evacuation and other instructions from local officials.

A Storm Surge Watch means there is a possibility of life-threatening inundation, from rising water moving inland from the coastline, in the indicated locations during the next 48 hours.

A Hurricane Warning means that hurricane conditions are expected somewhere within the warning area. A warning is typically issued 36 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous. Preparations to protect life and property should be rushed to completion.

A Hurricane Watch means that hurricane conditions are possible within the watch area. A watch is typically issued 48 hours before the anticipated first occurrence of tropical-storm-force winds, conditions that make outside preparations difficult or dangerous.

A Tropical Storm Watch means that tropical storm conditions are possible within the watch area, generally within 48 hours.

For storm information specific to your area, including possible inland watches and warnings, please monitor products issued by your local National Weather Service forecast office.

DISCUSSION AND OUTLOOK

At 800 PM AST (0000 UTC), the eye of Hurricane Florence was located by satellite near latitude 28.0 North, longitude 67.9 West. Florence is moving toward the west-northwest near 17 mph (28 km/h). A motion toward the west-northwest and northwest is expected through early Thursday. Florence is expected to slow down considerably by late Thursday into Friday. On the forecast track, the center of Florence will move over the southwestern Atlantic Ocean between Bermuda and the Bahamas through Wednesday, and approach the coast of North Carolina or South Carolina in the hurricane warning area on Thursday and Friday.

Maximum sustained winds are near 140 mph (220 km/h) with higher gusts. Florence is a category 4 hurricane on the Saffir-Simpson Hurricane Wind Scale. Strengthening is forecast tonight and Wednesday. While some weakening is expected on Thursday, Florence is forecast to be an extremely dangerous major hurricane through landfall.

Hurricane-force winds extend outward up to 60 miles (95 km) from the center and tropical-storm-force winds extend outward up to 175 miles (280 km).

The estimated minimum central pressure is 945 mb (27.91 inches).

HAZARDS AFFECTING LAND

STORM SURGE: The combination of a dangerous storm surge and the tide will cause normally dry areas near the coast to be flooded by rising waters moving inland from the shoreline. The water has the potential to reach the following heights above ground if peak surge occurs at the time of high tide...

Cape Fear to Cape Lookout, including the Neuse and Pamlico Rivers...9-13 ft

North Myrtle Beach to Cape Fear...6-9 ft

Cape Lookout to Ocracoke Inlet...6-9 ft

South Santee River to North Myrtle Beach...4-6 ft

Ocracoke Inlet to North Carolina/Virginia Border...4-6 ft

Edisto Beach to South Santee River...2-4 ft

The deepest water will occur along the immediate coast in areas of onshore winds, where the surge will be accompanied by large and destructive waves. Surge-related flooding depends on the relative timing of the surge and the tidal cycle, and can vary greatly over short distances. For information specific to your area, please see products issued by your local National Weather Service forecast office.

RAINFALL: Florence is expected to produce total rainfall accumulations of 15 to 25 inches with isolated maximum amounts of 35 inches near the storm's track over portions of the Carolinas and Mid-Atlantic States from late this week into early next week. This rainfall would produce catastrophic flash flooding and significant river flooding.

WIND: Hurricane conditions are expected to reach the coast within the hurricane warning area on Friday. Winds are expected to first reach tropical storm strength on Thursday, making outside preparations difficult or dangerous. Preparations to protect life and property should be rushed to completion.

SURF: Swells generated by Florence are affecting Bermuda and portions of the U.S. East Coast. These swells are likely to cause life-threatening surf and rip current conditions. Please consult products from your local weather office.

NEXT ADVISORY

Next complete advisory at 1100 PM AST.

TTAA00 KNHC DDHMM

Hurricane Florence Discussion Number 49

NWS National Hurricane Center Miami FL 1100 AM AST Tue Sep 11 2018
AL062018

Data from satellites and an Air Force Reserve reconnaissance aircraft mission indicate that Florence has completed an overnight eyewall replacement cycle (ERC). The recon data indicate that the eye has now expanded to a diameter of 30-32 n mi, and this was confirmed by an 1103Z SSMI/S microwave satellite image. The aircraft provided various intensity estimates with a peak SFMR surface wind of 113 kt noted in the northwest quadrant, a peak 700-mb flight-level wind of 143 kt in the northeast quadrant, and a central pressure of 950 mb. The 143-kt flight-level wind would normally correlate to an equivalent surface wind of about 129 kt. However, coincident SFMR surface winds were only 108 kt, indicating that the weak convection that region of the hurricane was not vigorous enough to bring down the strongest winds to the surface. The 950-mb central pressures corresponds to about 113 kt. Based on a blend of all these data, the initial intensity has been set to 115 kt.

The initial motion estimate is now 295/14 kt based on the recent recon fix data. The broken record continues -- there is no significant change to the previous track forecast or reasoning. Although the global and regional models continue to make minor shifts northward and southward, the consensus models have changed little. GOES-16 high-resolution water vapor imagery indicates that the amplifying large-scale flow pattern across CONUS is inducing a downstream ridge over the western Atlantic, with a high pressure cell centered northwest of Bermuda. This blocking ridge pattern is expected to keep Florence moving west-northwestward to northwest at around 15 kt for the next 48 hours or so. However, embedded within the large-scale flow is a weak shortwave trough over the central and southern Plains that is expected to eject out northeastward and weaken the ridging across the mid-Atlantic and southeastern U.S., causing Florence to slow down significantly in 72 hours as the powerful hurricane approaches the Carolinas. On days 4 and 5, an even slower motion or drift to the west and northwest is forecast, which will exacerbate the heavy rainfall threat. The new NHC forecast track is just an update of the previous one, and basically lies the middle of the guidance envelope between the consensus models TVCA to the north and HCCA and FSSE to the south.

Water vapor imagery indicates that Florence has finally developed the much anticipated dual outflow pattern, with outflow jets noted in the northwestern and eastern quadrants. The latter outflow jet is flowing into an upper-level low, which is acting as an impressive mass sink near 25N/49W. These two outflow channels are producing significant deformation stretching across Florence's inner-core, which should aid in the re-strengthening process. Now that the eye has become stable with a diameter of about 30 n mi and since Florence is expected to remain in a low-shear environment of around 5 kt and over above-average SSTs of 29.0-29.5 deg C, slow but steady strengthening is expected for the next 24-36 hours. By 48 h and beyond, Florence's slow forward speed, coupled with the large eye and relatively shallow depth of the warm water should induce some upwelling beneath the cyclone that will initiate a slow weakening trend. By 72 hours the vertical wind shear is expected to increase to near 20 kt from the southwest, which will cause more significant

weakening to occur. However, given the large overall wind field of Florence along with the large eye, only gradual weakening is expected. Once Florence moves inland, the slow forward speed of 3-5 kt will result in rapid spin down and weakening of the wind field. The new official intensity forecast is above of all of the intensity guidance based on the aforementioned very favorable synoptic outflow pattern, and to maintain continuity with the previous forecast.

Key Messages:

1. A life-threatening storm surge is likely along portions of the coastlines of South Carolina, North Carolina, and Virginia, and a Storm Surge Watch is in effect for a portion of this area. All interests from South Carolina into the mid-Atlantic region should ensure they have their hurricane plan in place and follow any advice given by local officials.
2. Life-threatening, catastrophic flash flooding and significant river flooding is possible over portions of the Carolinas and Mid-Atlantic states from late this week into early next week, as Florence is expected to slow down as it approaches the coast and moves inland.
3. Damaging hurricane-force winds are likely along portions of the coasts of South Carolina and North Carolina, and a Hurricane Watch is in effect for a part of this area. Damaging winds could also spread well inland into portions of the Carolinas and Virginia.
4. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week, resulting in life-threatening surf and rip currents.

Hurricane FLORENCE

ZCZC MIAPWSAT1 ALL

TTAA00 KNHC DDHHMM

HURRICANE FLORENCE WIND SPEED PROBABILITIES NUMBER 48

NWS NATIONAL HURRICANE CENTER MIAMI FL AL062018

0900 UTC TUE SEP 11 2018

AT 0900Z THE CENTER OF HURRICANE FLORENCE WAS LOCATED NEAR LATITUDE
26.4 NORTH...LONGITUDE 64.1 WEST WITH MAXIMUM SUSTAINED WINDS NEAR
120 KTS...140 MPH...220 KM/H.

Z INDICATES COORDINATED UNIVERSAL TIME (GREENWICH)

ATLANTIC STANDARD TIME (AST)...SUBTRACT 4 HOURS FROM Z TIME

EASTERN DAYLIGHT TIME (EDT)...SUBTRACT 4 HOURS FROM Z TIME

CENTRAL DAYLIGHT TIME (CDT)...SUBTRACT 5 HOURS FROM Z TIME

WIND SPEED PROBABILITY TABLE FOR SPECIFIC LOCATIONS

CHANCES OF SUSTAINED (1-MINUTE AVERAGE) WIND SPEEDS OF AT LEAST

...34 KT (39 MPH... 63 KM/H)...

...50 KT (58 MPH... 93 KM/H)...

...64 KT (74 MPH...119 KM/H)...

FOR LOCATIONS AND TIME PERIODS DURING THE NEXT 5 DAYS

PROBABILITIES FOR LOCATIONS ARE GIVEN AS OP(CP) WHERE

OP IS THE PROBABILITY OF THE EVENT BEGINNING DURING

AN INDIVIDUAL TIME PERIOD (ONSET PROBABILITY)

(CP) IS THE PROBABILITY OF THE EVENT OCCURRING BETWEEN

06Z TUE AND THE FORECAST HOUR (CUMULATIVE PROBABILITY)

PROBABILITIES ARE GIVEN IN PERCENT

X INDICATES PROBABILITIES LESS THAN 1 PERCENT

PROBABILITIES FOR 34 KT AND 50 KT ARE SHOWN AT A GIVEN LOCATION WHEN

THE 5-DAY CUMULATIVE PROBABILITY IS AT LEAST 3 PERCENT.

PROBABILITIES FOR 34...50...64 KT SHOWN WHEN THE 5-DAY

64-KT CUMULATIVE PROBABILITY IS AT LEAST 1 PERCENT.

HURRICANE FLORENCE FORECAST/ADVISORY NUMBER 48

NWS NATIONAL HURRICANE CENTER MIAMI FL 0900 UTC TUE SEP 11 2018

AL062018

CHANGES IN WATCHES AND WARNINGS WITH THIS ADVISORY...

A STORM SURGE WATCH HAS BEEN ISSUED FOR THE EAST COAST OF THE UNITED STATES FROM EDISTO BEACH...SOUTH CAROLINA NORTHWARD TO THE NORTH CAROLINA-VIRGINIA BORDER...INCLUDING THE PAMLICO AND ALBEMARLE SOUNDS.

A HURRICANE WATCH HAS BEEN ISSUED FOR THE EAST COAST OF THE UNITED STATES FROM EDISTO BEACH... SOUTH CAROLINA... NORTHWARD TO THE NORTH CAROLINA-VIRGINIA BORDER... INCLUDING THE PAMLICO AND ALBEMARLE SOUNDS.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT...

A STORM SURGE WATCH IS IN EFFECT FOR...

* EDISTO BEACH SOUTH CAROLINA TO THE NORTH CAROLINA-VIRGINIA BORDER
* ALBEMARLE AND PAMLICO SOUNDS...INCLUDING THE NEUSE AND PAMLICO RIVERS

A HURRICANE WATCH IS IN EFFECT FOR...

* EDISTO BEACH SOUTH CAROLINA TO THE NORTH CAROLINA-VIRGINIA BORDER
* ALBEMARLE AND PAMLICO SOUNDS

INTERESTS ELSEWHERE IN THE SOUTHEASTERN AND MID-ATLANTIC STATES SHOULD MONITOR THE PROGRESS OF FLORENCE. ADDITIONAL WATCHES MAY BE REQUIRED LATER TODAY.

A STORM SURGE WATCH MEANS THERE IS A POSSIBILITY OF LIFE-THREATENING INUNDATION... FROM RISING WATER MOVING INLAND FROM THE COASTLINE... IN THE INDICATED LOCATIONS DURING THE NEXT 48 HOURS. FOR A DEPICTION OF AREAS AT RISK... PLEASE SEE THE NATIONAL WEATHER SERVICE STORM SURGE WATCH/WARNING GRAPHIC... AVAILABLE AT HURRICANES.GOV.

A HURRICANE WATCH MEANS THAT HURRICANE CONDITIONS ARE POSSIBLE WITHIN THE WATCH AREA. A WATCH IS TYPICALLY ISSUED 48 HOURS BEFORE THE ANTICIPATED FIRST OCCURRENCE OF TROPICAL-STORM-FORCE WINDS... CONDITIONS THAT MAKE OUTSIDE PREPARATIONS DIFFICULT OR DANGEROUS.

HURRICANE CENTER LOCATED NEAR 26.4N 64.1W AT 11/0900Z

Hurricane Florence Discussion Number 48

NWS National Hurricane Center Miami FL 500 AM AST Tue Sep 11 2018
AL062018

Recent satellite imagery shows that the eye of Florence has become cloud filled and an earlier 0441 UTC microwave overpass revealed a double eyewall structure. These observations suggest that an eyewall replacement cycle is likely underway. Subjective and objective Dvorak current intensity numbers have not changed so the initial intensity will remain 120 kt for this advisory. An Air Force Reserve Hurricane Hunter mission is en route to the storm and should provide a better assessment of Florence's structure and intensity this morning. NOAA buoy 41049 located about 80 nmi north of the eye, has reported tropical-storm-force winds during the last several hours and seas as high as 23 ft. Florence's upper-level environment is predicted to remain quite

favorable while the storm traverses sea surface temperatures of around 29C over the next 48 hours. Additional strengthening is forecast during this time, but some fluctuations in intensity are likely due to eyewall replacement cycles. The updated NHC intensity forecast once again calls for additional intensification and brings Florence to near category 5 strength within the next 24 to 36 hours. After 48 hours, a slight increase in southwesterly shear could result in some weakening, but Florence is expected to remain an extremely dangerous hurricane when it approaches the U.S. coastline.

Florence has accelerated as anticipated and is now moving west-northwestward or 290 degrees at 13 kt. The track forecast reasoning has not changed much. A mid-level ridge to the northeast of Bermuda is expected steer Florence quickly west-northwestward to northwestward toward the southeast United States coast over the next 2 to 3 days. By 72 hours, a high pressure ridge building over the Upper-Midwest and Great Lakes regions is forecast to cause a significant reduction in Florence's forward speed and the hurricane is predicted to meander over the eastern portions of North or South Carolina at days 4 and 5. The ECMWF has trended slower this cycle at days 4 and 5, and as a result the NHC forecast shows slightly less motion at those time periods. The spread in the guidance increases by 72 hours, with the GFS and its ensemble mean along the right side of the guidance, while the ECMWF remains along the left edge. It should be noted that there are still a number of ECMWF members that are even farther left. The NHC track forecast has been nudged to the left and is close to the TVCN consensus aid. Given the amount of uncertainty by day 3, it is important not to focus on the exact forecast track as average NHC errors at days 3, 4, and 5 are about 100, 140 and 180 n mi, respectively, and dangerous hazards will extend well away from the center. Storm Surge and Hurricane watches have been issued for a portion of the coast of South and North Carolina. Additional watches may be required later today.

Key Messages:

1. A life-threatening storm surge is likely along portions of the coastlines of South Carolina, North Carolina, and Virginia, and a Storm Surge Watch has been issued for a portion of this area. All interests from South Carolina into the mid-Atlantic region should ensure they have their hurricane plan in place and follow any advice given by local officials.
2. Life-threatening freshwater flooding is likely from a prolonged and exceptionally heavy rainfall event, which may extend inland over the Carolinas and Mid Atlantic for hundreds of miles as Florence is expected to slow down as it approaches the coast and moves inland.
3. Damaging hurricane-force winds are likely along portions of the coasts of South Carolina and North Carolina, and a Hurricane Watch has been issued for a part of this area. Damaging winds could also spread well inland into portions of the Carolinas and Virginia.
4. Large swells affecting Bermuda and portions of the U.S. East Coast will continue this week, resulting in life-threatening surf and rip currents.

FORECAST POSITIONS AND MAX WINDS

INIT 11/0900Z 26.4N 64.1W 120 KT 140 MPH

Potential Tropical Cyclone SIX

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Potential Tropical Cyclone Six Discussion Number 4

NWS National Hurricane Center Miami FL AL062018

500 AM AST Fri Aug 31 2018

Even though the circulation is gradually becoming less elongated, there is still relatively little deep convection near the estimated center of circulation. Instead, most of the convection remains confined to the monsoon trough southwest of the center, where low-level convergence is strongest. Therefore, the system is not quite yet being designated as a tropical cyclone.

Global model fields suggest that the low should detach from the monsoon trough within the next 12 hours, which would likely allow deep convection to form closer to the center. Assuming that happens, the system is also forecast to strengthen and become a tropical storm by this afternoon while it approaches the southern Cabo Verde Islands. Although vertical shear is expected to be relatively light for much of the forecast period, sea surface temperatures ahead of the system are marginal, and the low will likely move over a minimum of oceanic heat content in 48-72 hours. Adding on top of that a drier mid-level environment, only gradual strengthening is anticipated through day 5. A majority of the intensity models agree on this scenario, with the exception of the HWRF model, which brings the system close to major hurricane strength at the end of the forecast period. Since that solution is discounted at the moment, the NHC intensity forecast is below the HCCA guidance and closest to the intensity consensus.

The low appears to have turned west-northwestward with an initial motion of 285/10 kt. A mid-level high centered west of the Canary Islands should continue to steer the disturbance west-northwestward at a faster clip for the next 4 days or so. By the end of the forecast period, a weakness in the ridge over the eastern Atlantic could cause the system to turn northwestward. The new NHC track forecast is a little slower than the previous one during the first 72 hours and then a little to the west on days 4 and 5 to better match the latest guidance envelope.

Potential Tropical Cyclone SIX

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Potential Tropical Cyclone Six Discussion Number 5

NWS National Hurricane Center Miami FL AL062018

1100 AM AST Fri Aug 31 2018

The circulation is better defined this morning, but the associated convection is rather weak. In fact, Dvorak numbers have not changed overall, and do not support classifying the system as a tropical cyclone yet. It seems like both NHC and the global models predicted the development of a cyclone too soon. Nevertheless, the environmental conditions are favorable for both genesis and strengthening, and a tropical depression or a storm is expected to form later today or Saturday. The shear does not appear to be a problem at this time, but the cyclone should be moving over marginal SSTs, limiting the amount of intensification. The HWRF model changed its tune to a more reasonable one, and it now shows more modest strengthening. The NHC forecast is similar to the previous one, and continues to be very close to the intensity consensus. The disturbance is moving toward the west-northwest or 285 degrees at about 11 kt. The subtropical high should continue to steer the system toward the west-northwest with some increase in forward speed for the next 2 to 3 days. After that time, a weakness in the ridge will induce a more northwestward track over the open Atlantic Ocean. This is supported by the track guidance which continues to be in very good agreement for the next 3 days. Thereafter, the guidance envelope widens and becomes bounded by the westernmost ECMWF and the easternmost GFS models decreasing the confidence in the track forecast.

Tropical Depression SIX

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Depression Six Discussion Number 6

NWS National Hurricane Center Miami FL 500 PM AST Fri Aug 31 2018

AL062018

High resolution satellite images reveal that the disturbance has developed a well-defined circulation with a cyclonically curved convective band near the center, and plenty of showers in the southern semicircle. The surface pressure in the Cabo Verde Island of Santiago dropped to 1005 mb at 1800 UTC as the cyclone passed to its south. In addition, Dvorak numbers are gradually increasing, and now support classifying the system as a tropical depression.

The depression is becoming better organized, and it will most likely reach tropical storm status in the next several hours. The environmental conditions are favorable for some strengthening during the next 2 to 3 days while the shear is low. Later in the forecast period, the shear is expected to increase, and the SSTs will become marginal halting the strengthening process. The models, primarily the HRRF, are a little less aggressive with the intensity, so the NHC forecast is adjusted slightly downward.

Now that the center has formed, we have a better estimate of the initial motion, which is toward the west or 270 degrees at 13 kt. The depression is gradually becoming steered by the flow around the subtropical ridge, and consequently it has increased its forward speed. This prevailing flow pattern should keep the cyclone on a general west to west-northwest track for the next 2 to 3 days. After that time, a weakness in the ridge will induce a more northwestward to north-northwestward track over the open Atlantic Ocean. The track guidance is very consistent with this solution mainly for the next 3 days. Thereafter, the confidence in the track forecast decreases as the guidance envelope widens and becomes bounded by the westernmost ECMWF and the easternmost HWFI. The NHC forecast continues to be in the middle of the envelope and is very close to the corrected consensus HCCA, which has had great skill so far this year.

Potential Tropical Cyclone Six Advisory Number 4

NWS National Hurricane Center Miami FL AL062018

500 AM AST Fri Aug 31 2018

...TROPICAL STORM CONDITIONS EXPECTED OVER THE SOUTHERN CABO
VERDE ISLANDS LATER TODAY...

SUMMARY OF 500 AM AST...0900 UTC...INFORMATION

LOCATION...13.6N 21.4W

ABOUT 215 MI...350 KM ESE OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...35 MPH...55 KM/H

PRESENT MOVEMENT...WNW OR 285 DEGREES AT 12 MPH...19 KM/H

MINIMUM CENTRAL PRESSURE...1006 MB...29.71 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Cabo Verde Islands of Santiago, Fogo, and Brava

A Tropical Storm Warning means that tropical storm conditions are
expected somewhere within the warning area, in this case within the
next 12 to 24 hours.

For storm information specific to your area, please monitor products
issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 500 AM AST (0900 UTC), the disturbance was centered near latitude
13.6 North, longitude 21.4 West. The system is moving toward the
west-northwest near 12 mph (19 km/h), and this motion at a slightly
faster forward speed is expected to continue for the next three to
four days. On the forecast track, disturbance is expected to move
near or over the southern Cabo Verde Islands as a tropical storm
later today and tonight.

Maximum sustained winds are near 35 mph (55 km/h) with higher gusts. Strengthening is forecast during the next several days, and the disturbance is expected to become a tropical storm later today. Environmental conditions are favorable for the system to become a tropical cyclone later today.

* Formation chance through 48 hours...high...90 percent

* Formation chance through 5 days...high...90 percent

The estimated minimum central pressure is 1006 mb (29.71 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce total rain accumulations of 4 to 8 inches across the southern Cabo Verde Islands. These rains could produce life-threatening flash floods.

WINDS: Tropical storm conditions are expected in the southern Cabo Verde Islands later today and tonight.

NEXT ADVISORY

Next intermediate advisory at 800 AM AST.

Next complete advisory at 1100 AM AST.

Tropical Depression SIX

ZCZC MIATCDAT1 ALL

TTAA00 KNHC DDHHMM

Tropical Depression Six Discussion Number 7

NWS National Hurricane Center Miami FL 1100 PM AST Fri Aug 31 2018

AL062018

Convection associated with the depression is becoming more concentrated, although the center still appears to be near the eastern edge of the convective mass. The latest satellite intensity estimates from TAFB and SAB are 30 and 25 kt respectively, while the CIMSS satellite consensus method suggests the cyclone has become a tropical storm. Based on the available data, the initial intensity remains a possibly conservative 30 kt. The depression is feeling the effects of moderate easterly vertical wind shear, with little or no cirrus outflow in the eastern semicircle.

The initial motion is now 285/12. Deep layer easterly or east-southeasterly flow on the south side of the subtropical ridge should steer the cyclone generally west-northwestward across the open Atlantic ocean for the next 3-4 days. After that time, the cyclone is expected to turn northwestward toward a weakness in the subtropical ridge. The track guidance remains in good agreement with this scenario, although there remains some spread on how sharp the turn will be near the end of the forecast period. The new forecast track, which is an update of the previous forecast, is near the various consensus models.

While the current shear is expected to subside during the next day or so, the forecast track takes the cyclone over waters that cool to near 26C in about 48 h. The intensity forecast thus calls for

only gradual intensification through this time. After 48-72 h, the system should move over warmer water, but also should encounter increasing westerly shear. The intensity guidance responds to this combination of ingredients by showing little change in strength. The new intensity forecast, which is unchanged from the previous forecast, is in the stronger portion of the intensity guidance and above the forecasts of the consensus models.

FORECAST POSITIONS AND MAX WINDS

INIT 01/0300Z 14.2N 25.5W 30 KT 35 MPH

BULLETIN

Tropical Depression Six Advisory Number 6

NWS National Hurricane Center Miami FL 500 PM AST Fri Aug 31 2018

AL062018

...TROPICAL DEPRESSION FORMS JUST SOUTH OF THE CABO VERDE
ISLANDS...

...RAINBANDS AND GUSTY WINDS AFFECTING THOSE ISLANDS...

SUMMARY OF 500 PM AST...2100 UTC...INFORMATION

LOCATION...13.8N 24.7W

ABOUT 70 MI...115 KM SSW OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...35 MPH...55 KM/H

PRESENT MOVEMENT...W OR 270 DEGREES AT 15 MPH...24 KM/H

MINIMUM CENTRAL PRESSURE...1004 MB...29.65 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Cabo Verde Islands of Santiago, Fogo, and Brava

A Tropical Storm Warning means that tropical storm conditions are

expected somewhere within the warning area, in this case within the next 6 to 12 hours.

For storm information specific to your area, please monitor products issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 500 PM AST (2100 UTC), the center of newly formed Tropical Depression Six was located near latitude 13.8 North, longitude 24.7 West. The depression is moving toward the west near 15 mph (24 km/h), and this track with a gradual turn to the west-northwest is expected for the next two or three days. On the forecast track, the depression will be passing just south of the Cabo Verde Islands tonight and Saturday. The depression should then be moving over the open eastern Atlantic on Sunday and Monday.

Maximum sustained winds are near 35 mph (55 km/h) with higher gusts. Strengthening is forecast, and the depression is expected to become a tropical storm tonight or Saturday.

The estimated minimum central pressure based on observations from the Cabo Verde Islands is 1004 mb (29.65 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce total rain accumulations of 2 to 4 inches across the southern Cabo Verde Islands with isolated maximum totals of 8 inches possible. These rains could produce life-threatening flash floods.

WINDS: Tropical storm conditions are expected to continue in the southern Cabo Verde Islands tonight. Winds should subside on Saturday.

NEXT ADVISORY

Next intermediate advisory at 800 PM AST.

Next complete advisory at 1100 PM AST.

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Cabo Verde Islands of Santiago, Fogo, and Brava

A Tropical Storm Warning means that tropical storm conditions are expected somewhere within the warning area, in this case within the next 6 to 12 hours.

For storm information specific to your area, please monitor products issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 1100 PM AST (0300 UTC), the center of Tropical Depression Six was located near latitude 14.2 North, longitude 25.5 West. The depression is moving toward the west-northwest near 14 mph (22 km/h), and this general motion is expected to continue for the next several days. On the forecast track, the depression will be passing just to the west-southwest of the Cabo Verde Islands tonight and Saturday morning. The depression should then be moving over the open eastern Atlantic on Sunday and Monday.

Maximum sustained winds are near 35 mph (55 km/h) with higher gusts. Strengthening is forecast, and the depression is expected to become a tropical storm on Saturday.

The estimated minimum central pressure is 1004 mb (29.65 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce an additional 1 to 2 inches of rain across the southern Cabo Verde Islands through Saturday.

WINDS: Tropical storm conditions are expected to continue in the southern Cabo Verde Islands tonight. Winds should subside on

Saturday.

BULLETIN

Potential Tropical Cyclone Six Intermediate Advisory Number 3A

NWS National Hurricane Center Miami FL AL062018

200 AM AST Fri Aug 31 2018

...DISTURBANCE MOVING CLOSER TO THE SOUTHERN CABO VERDE ISLANDS...

SUMMARY OF 200 AM AST...0600 UTC...INFORMATION

LOCATION...13.4N 21.2W

ABOUT 235 MI...380 KM ESE OF THE SOUTHERNMOST CABO VERDE ISLANDS

MAXIMUM SUSTAINED WINDS...35 MPH...55 KM/H

PRESENT MOVEMENT...W OR 280 DEGREES AT 13 MPH...20 KM/H

MINIMUM CENTRAL PRESSURE...1007 MB...29.74 INCHES

WATCHES AND WARNINGS

CHANGES WITH THIS ADVISORY:

None.

SUMMARY OF WATCHES AND WARNINGS IN EFFECT:

A Tropical Storm Warning is in effect for...

* Cabo Verde Islands of Santiago, Fogo, and Brava

A Tropical Storm Warning means that tropical storm conditions are expected somewhere within the warning area, in this case, within the next 24 to 36 hours.

For storm information specific to your area, please monitor products issued by your national meteorological service.

DISCUSSION AND OUTLOOK

At 200 AM AST (0600 UTC), the disturbance was centered near latitude 13.4 North, longitude 21.2 West. The system is moving toward the west near 13 mph (20 km/h), and a general motion toward the west-northwest with an increase in forward speed is expected during the next 2 to 3 days. On the forecast track, the disturbance or the tropical cyclone is expected to move near or over the southern Cabo Verde Islands later today and tonight.

Maximum sustained winds are near 35 mph (55 km/h) with higher gusts. Strengthening is forecast, and the disturbance is expected to become a tropical storm later today or tonight.

Environmental conditions are favorable for the system to become a tropical cyclone later today.

* Formation chance through 48 hours... high...90 percent

* Formation chance through 5 days...high...90 percent

The estimated minimum central pressure is 1007 mb (29.74 inches).

HAZARDS AFFECTING LAND

RAINFALL: The system could produce total rain accumulations of 4 to 8 inches across the southern Cabo Verde Islands. These rains could produce life-threatening flash floods.

WINDS: Tropical storm conditions are expected in the southern Cabo Verde Islands later today and tonight.

NEXT ADVISORY

Next complete advisory at 500 AM AST.
